Thank You…
From Featherlite Trailers

Dear Customer,

Thank you for purchasing a Featherlite Trailer.

You are now part of tens of thousands in North America who enjoy Featherlite Trailers for their premium grade construction, innovative features and custom interiors. Featherlite builds hundreds of different standard and custom-designed aluminum specialty trailers and transporters. For each and every one, customer satisfaction is Featherlite’s passion and safety is top priority.

Featherlite knows the most important thing that goes into each and every trailer is what you, our customer, put in it. That is why the features of all Featherlite trailers are engineered with the customer and the cargo in mind.

Please know that Featherlite’s dedicated dealers and employees are here for you. Let Featherlite know how we can be of service now and in the future.

Thanks again and best wishes!

Featherlite Trailers

THANK YOU FOR CHOOSING FEATHERLITE!

**WARNING**

This User’s Manual contains safety information and instructions for your trailer.

You must read this manual before loading or towing your trailer.

You must follow all safety precautions and instructions.

“Portions of this manual were used with the expressed authority of Dexter Axle, but Dexter Axle is not responsible for the accuracy of the information contained herein.”
1.1 SAFETY ALERT SYMBOLS AND SIGNAL WORDS

This manual provides instructions for the operation and care of Featherlite Horse, Livestock and Enclosed Trailers. The instructions in this manual must be followed to ensure the safety of persons, horses and livestock, and satisfactory life of the trailer. Safety precautions to protect against injury or property damage must be followed at all times.

An Owner’s Manual that provides general trailer information cannot cover all of the specific details necessary for the proper combination of every trailer, tow vehicle and hitch. Therefore, you must read, understand and follow the instructions given by the tow vehicle and trailer hitch manufacturers, as well as the instructions in this manual.

Our trailers are built with components produced by various manufacturers. Some of these items have separate instruction manuals. Where this manual indicates that you should read another manual, and you do not have that manual, call Featherlite, Inc. at 800-800-1230.

The safety information in this manual is denoted by the safety alert symbol: 

The level of risk is indicated by the following signal words:

**DANGER**

_DANGER – Immediate hazards which WILL result in severe personal injury or death if the warning is ignored._

**WARNING**

_WARNING – Hazards or unsafe practices which COULD result in severe personal injury or death if the warning is ignored._

1.2 MAJOR HAZARDS

Loss of control of the trailer or trailer/tow vehicle combination can result in death or serious injury. The most common causes for loss of control of the trailer are:

- Improper sizing the trailer for the tow vehicle, or vice versa.
- Excessive Speed: Driving too fast for the conditions.
- Failure to adjust driving behavior when towing a trailer.
- Overloading and/or improper weight distribution.
- Improper or mis-coupling of the trailer to the hitch.
- Improper braking and steering under sway conditions.
- Not maintaining proper tire pressure.
- Not keeping lug nuts tight.

1.2.1 Improper Sizing of the Trailer to the Tow Vehicle.

Trailers that weigh too much for the towing vehicle can cause stability problems, which can lead to death or serious injury. Furthermore, the additional strain put on the engine and drive-train may lead to serious tow vehicle maintenance problems. For these reasons the maximum towing capacity of your towing vehicle should not be exceeded. The towing capacity of your tow vehicle, in terms of maximum Gross Trailer Weight (GTW) and maximum Gross Combined Weight Rating (GCWR) can be found in the tow vehicles Owner’s Manual.
Section 1 - Safety Information

1.2.2 Driving Too Fast

With ideal road conditions, the maximum recommended speed for safely towing a trailer is 60 mph. If you drive too fast, the trailer is more likely to sway, thus increasing the possibility for loss of control. Also your tires may overheat, thus increasing the possibility of a blowout.

1.2.3 Failure to Adjust Driving Behavior When Towing a Trailer

When towing a trailer, you will have decreased acceleration, increased stopping distance, and increased turning radius (which means you must make wider turns to keep from hitting curbs, vehicles, and anything else that is on the inside corner). Furthermore, the trailer will change the handling characteristics of your towing vehicle, making it more sensitive to steering inputs and more likely to be pushed around in windy conditions or when being passed by large vehicles. In addition, you will need a longer distance to pass, due to slower acceleration and increased length. With this in mind:

- Be alert for slippery conditions. You are more likely to be affected by slippery road surfaces when driving a tow vehicle with a trailer, than driving a tow vehicle without a trailer.
- Anticipate the trailer “swaying.” Swaying can be caused by excessive steering, wind gusts, roadway edges, or by the trailer reaction to the pressure wave created by passing trucks and busses.
- When encountering trailer sway, take your foot off the accelerator, and steer as little as possible in order to stay on the road. Use small “trim-like” steering adjustments. Do not attempt to steer out of the sway; you’ll only make it worse. Also, do not apply the tow vehicle brakes to correct trailer swaying. The application of the trailer brakes alone will tend to straighten out the combination, especially when going downhill.
- Check rearview mirrors frequently to observe the trailer and traffic.
- Use lower gear when driving down steep or long grades. Use the engine and transmission as a brake. Do not ride the brakes, as they can overheat and become ineffective.
- Be aware of your trailer height, especially when approaching bridges, roofed areas and around trees.

1.2.4 Improper Loading

The total weight of the load you put in or on the trailer, plus the empty weight of the trailer itself, must not exceed the trailer's Gross Vehicle Weight Rating (GVWR). If you do not know the empty weight of the trailer, you must measure it at a commercial scale. In addition, you must distribute the load in the trailer such that the load on any axle does not exceed the Gross Axle Weight Rating (GAWR). The GVWR and GAWR’s are listed on the Certification / VIN label mounted on the front left side of the trailer.
1.2.5 Trailer Not Properly Coupled to the Hitch

It is critical that the trailer be securely coupled to the hitch, and that the safety chains and emergency breakaway brake lanyard are correctly attached. Uncoupling may result in death or serious injury to you and to others.

**WARNING**

Coupler and hitch selection and condition are critical for safe towing.

Uncoupling can result in death or serious injury.

- Make sure the hitch and ball are rated for the trailer.
- Make sure the hitch [ball size] matches the coupler.
- Check the hitch ball for wear, corrosion and cracks before coupling. Replace worn, corroded or cracked hitch ball before coupling to the trailer.
- Make sure the hitch ball is tight to the hitch before coupling the trailer.

**WARNING**

An improperly coupled trailer can result in death or serious injury.

Do not move the trailer until:

- The coupler is secured and locked;
- The safety chains are secured to the tow vehicle; and
- The trailer jacks are fully retracted.

Do not tow the trailer on the road until:

- The trailer brakes are checked;
- The breakaway switch is connected to the tow vehicle;
- The load is secured to the trailer; and
- The trailer lights are connected and checked.

1.2.6 Proper Use of Safety Chains

Safety chains are provided so that control of the trailer can still be maintained if the trailer comes loose from the tow vehicle for any reason.

1.2.7 Proper Connection of Breakaway Brake

If equipped with brakes, your trailer will be equipped with a breakaway brake system that can apply the brakes on your trailer, if your trailer comes loose from the hitch for any reason. You will have a separate set of instructions for the breakaway brake if your trailer is so equipped. The breakaway brake system, including battery, must be in good condition and properly rigged to be effective.

**WARNING**

An ineffective breakaway brake system can result in a runaway trailer, leading to death or serious injury if the coupler or ball hitch fails.

Test the function of the breakaway brake system before towing the trailer. Do not tow the trailer if the breakaway brake system is not working; have it serviced or repaired.

Connect the breakaway lanyard to the tow vehicle -

**NOT to the safety chain; and**

**NOT to the hitch, ball or support.**
1.2.8 Matching Trailer and Hitch

**DANGER**

Use of an under-rated hitch, ball or tow vehicle can result in loss of control leading to death or serious injury.
Make certain your hitch and tow vehicle are rated for your trailer.

1.2.9 Worn Tires, Loose Wheels and Lug Nuts

Just as with your tow vehicle, the trailer tires and wheels are important safety items. Therefore, it is essential to inspect the trailer tires before each tow.

If a tire has a bald spot, bulge, cut, cracks, or is showing any cords, replace the tire before towing. If a tire has uneven tread wear, take the trailer to a dealer service center for diagnosis. Uneven tread wear can be caused by tire imbalance, axle misalignment or incorrect inflation.

Tires with too little tread will not provide adequate frictional forces on wet roadways and can result in loss of control, leading to death or serious injury.

Improper tire pressure causes increased tire wear and may reduce trailer stability, which can result in a tire blowout or possible loss of control. Therefore, before each tow you must also check the tire pressure. Remember, the proper tire pressure is listed on the Certification (VIN) label, and should be checked when tires are cold. Allow 3 hours cool-down after driving as much as 1 mile at 40 mph before checking tire pressure.

**WARNING**

Metal creep between the wheel rim and lug nuts (bolts) will cause rim to loosen. Death or injury can occur if wheel comes off.
Tighten lug nuts (bolts) before each tow.

The proper tightening sequence and tightness (torque) for lug nuts is listed in the “Inspection, Service & Maintenance” chapter of this manual. Use a calibrated torque wrench to tighten the lug nuts.

Lug nuts are also prone to loosen after first being assembled. When driving a new trailer (or after wheels have been remounted), check to make sure they are tightened to the proper torque after the first 10, 25 and 50 miles of driving and before each tow thereafter.

Failure to perform this check can result in a wheel parting from the trailer and a crash, leading to death or serious injury.

**WARNING**

Lug nuts are prone to loosen after being first assembled. Death or serious injury can result.
Check lug nuts for tightness on a new trailer, and after re-mounting a wheel at 10, 25 and 50 miles.

**WARNING**

Inadequate lug nut torque can cause a wheel to part while towing. Death or serious injury can result.
Make sure lug nuts are tight before towing trailer.
Section 1 - Safety Information

1.2.10 Weight And Load Distribution

Proper loading of your trailer is essential for your safety. Tire, wheel, axle or structural failure can be caused by overloading.

**WARNING**

An overloaded trailer can result in failure or in loss of control of the trailer, leading to death or serious injury.

Never load a trailer so that the weight on any tire exceeds its rating.

Never exceed the trailer Gross Vehicle Weight Rating (GVWR).

Never exceed an axle Gross Axle Weight Rating (GAWR).

Improper front / rear load distribution can lead to poor trailer sway stability or poor tow vehicle handling. Poor trailer sway stability results from tongue weights that are too low, and poor tow vehicle stability results from tongue weights that are too high.

In figure 1-1, the second column shows the rule of thumb percentage of total weight of the trailer, plus its cargo (Gross Trailer Weight, or “GTW”) that should appear on the tongue of the trailer. For example, a trailer with a gooseneck hitch, with a loaded weight of 12,000 pounds, should have 20-25% of 12,000 pounds (2400-3000 lbs.) on the gooseneck. After loading, be sure to check that none of the axles are overloaded.

<table>
<thead>
<tr>
<th>Type of Hitch</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ball Hitch (or Bumper Hitch)</td>
<td>10–15% for large trailers</td>
</tr>
<tr>

<td>6-10% for smaller utility and cargo trailers</td>
</tr>
<tr>
<td>Gooseneck Hitch</td>
<td>20–25%</td>
</tr>
<tr>
<td>Fifth Wheel Hitch</td>
<td></td>
</tr>
</tbody>
</table>

Tongue Weight Chart - Figure 1-1

Uneven left / right load distribution can cause tire, wheel, axle or structural failure. Be sure your trailer is evenly loaded left / right. Towing stability also depends on keeping the center of gravity as low as possible.

**WARNING**

An improperly distributed load can result in loss of control of the trailer, and can lead to death or serious injury.

Proper tongue weight is essential for stable trailer handling.

Distribute the load front to rear to provide proper tongue weight.

Distribute the load evenly, right and left, to avoid tire overload.

Keeping the center of gravity low and centered is essential to minimize the risk of tip-over.

1.2.11 Shifting Cargo

Since the trailer “ride” can be bumpy and rough, you must secure your cargo so that it does not shift while the trailer is being towed.

**WARNING**

A shifting load can result in failure, or to loss of control of the trailer, and can lead to death or serious injury.

You must tie down all loads with proper sized fasteners, ropes, straps, etc. to prevent the load from shifting while trailering.

1.2.12 Inappropriate Cargo

Your trailer may be designed for specific cargo, for example, only for horses. If your trailer is designed for specific cargo, only carry that cargo in the trailer. Your trailer must not be used to carry certain items, such as people, containers of hazardous substances or containers of flammable substances. A trailer not designed with living quarters should only be used for transportation of its intended cargo.
1.2.13 Inoperable Brakes, Lights or Mirrors

Be sure that the brakes (if equipped) and all of the lights on your trailer are functioning properly before towing your trailer. Electric brakes and lights on a trailer are controlled via a connection to the tow vehicle, generally a multi-pin electrical connector. Check the trailer taillights by turning on your tow vehicle headlights. Check the trailer brake lights by having someone step on the tow vehicle brake pedal while you look at trailer lights. Check the turn signal lights by operating the turn signal lever in the tow vehicle.

If your trailer has electric brakes, your tow vehicle will have an electric brake controller that sends power to the trailer brakes. Before towing the trailer on the road, you must operate the brake controller while trying to pull the trailer in order to confirm that the electric brakes operate. While towing the trailer at less than 5 mph, manually operate the electric brake controller in the tow vehicle cab. You should feel the operation of the trailer brakes.

If your trailer has hydraulic “surge” brakes, pull the emergency breakaway brake lanyard to check the operation of the surge mechanism.

Standard mirrors usually do not provide adequate visibility for viewing traffic to the sides and rear a towed trailer. You must provide mirrors that allow you to safely observe approaching traffic.

1.2.14 Hazards From Operation Of The Dump Body

The major hazards from operation of the dump body are:
- Overloading
- Improper weight distribution; both side to side and front to back.
- Getting under a raised dump body.
- Not using or improperly using body props.
- Modifying or altering hydraulic components.
- Modifying or altering dump controls.
- Not dumping from a solid and level foundation.
- Not fully opening rear doors when dumping.
- Jerking the trailer or hydraulics to loosen the load.
- Trailer coming near or contacting power lines when body is raised.

The tow vehicle and trailer MUST be on a firm and level surface before raising the dump body. Raising the dump body while either the tow vehicle and/or trailer are on a soft and/or uneven surface may result in the tow vehicle and trailer overturning.

If your trailer has hydraulic “surge” brakes, pull the emergency breakaway brake lanyard to check the operation of the surge mechanism.

Standard mirrors usually do not provide adequate visibility for viewing traffic to the sides and rear a towed trailer. You must provide mirrors that allow you to safely observe approaching traffic.

NEVER use an auxiliary device to “help” the hydraulic system raise the dump body.

Do not alter or substitute any hydraulic components on the trailer. The hydraulic system is designed
with each component being compatible with the safe and reliable operation of the hydraulic system. Under no circumstances should you alter the hydraulic pressure or flow rate to the hydraulic system. Doing so can result in death or serious injury.

**DANGER**

NEVER alter or substitute any hydraulic system component. Death or serious injury may result.

An altered or component substituted hydraulic system may malfunction, resulting in the dump body falling without warning.

NEVER alter or substitute any hydraulic system component.

Verify that there are no overhead power lines near the trailer before raising the dump body. You can be electrocuted if the trailer comes near or contacts a power line.

**WARNING**

Risk of death by crushing.

Dump body can drop unexpectedly.

NEVER go under a raised dump body.

Use body prop for maintenance.

### 1.2.15 Hazards From Operation Of The Tilt Deck

The major hazards from operation of the tilt deck are:

- Overloading.
- Improper weight distribution; both side to side and front to back.
- Getting under a raised tilt deck.
- Not using or improperly using tilt deck prop.
- Modifying or altering hydraulic components.
- Modifying or altering dump controls.

**WARNING**

An overloaded trailer can cause the hydraulic system to malfunction, resulting in the tilt deck falling.

NEVER use an auxiliary device to “help” the hydraulic system raise the tilt deck.

Do not alter or substitute any hydraulic components on the trailer. The hydraulic system is designed with each component being compatible with the safe and reliable operation of the hydraulic system. Under no circumstances should you alter the hydraulic pressure or flow rate to the hydraulic system. Doing so can result in death or serious injury.

The raised dump body **MUST** be supported by the body props before entering the area under the dump body for any reason. Empty the dump body before using body props.

**DANGER**

Risk of death or serious injury.

NEVER support a loaded dump body by the body prop.

Empty dump body before using body prop.

NEVER enter the area under the dump body unless the empty dump body is supported by the body props.
Section 1 - Safety Information

1.2.17 Trailer Towing Guide

Driving a vehicle with a trailer in tow is vastly different from driving the same vehicle without a trailer in tow. Acceleration, maneuverability and braking are all diminished with a trailer in tow. It takes longer to get up to speed, you need more room to turn and pass, and more distance to stop when towing a trailer. You will need to spend time adjusting to the different feel and maneuverability of the tow vehicle with a loaded trailer. Because of the significant differences in all aspects of maneuverability when towing a trailer, the hazards and risks of injury are also much greater than when driving without a trailer. You are responsible for keeping your vehicle and trailer in control, and for all the damage that is caused if you lose control of your vehicle and trailer.

As you did when learning to drive an automobile, find an open area with little or no traffic for your first practice trailering. Of course, before you start towing the trailer, you must follow all of the instructions for inspection, testing, loading and coupling. Also, before you start towing, adjust the mirrors so you can see the trailer as well as the area to the rear of it.

Drive slowly at first, 5 m.p.h. or so, and turn the wheel to get the feel of how the tow vehicle and trailer combination responds. Next, make some right and left hand turns. Watch in your side mirrors to see how the trailer follows the tow vehicle. Turning with a trailer attached requires more room.

Stop the rig a few times from speeds no greater than 10 m.p.h. If your trailer is equipped with brakes, try using different combinations of trailer/electric brake and tow vehicle brake. Note the effect that the trailer brakes have when they are the only brakes used. When properly adjusted, the trailer brakes will come on just before the tow vehicle brakes.

It will take practice to learn how to back up a tow vehicle with a trailer attached. Take it slow. Before backing up, get out of the tow vehicle and look behind the trailer to make sure that there are no obstacles. Some drivers place their hands at the bottom of the steering wheel, and while the tow vehicle is in reverse, “think” of the hands as being on the top of the wheel. When the hands move to

---

### DANGER

NEVER alter or substitute any hydraulic system component. Death or serious injury may result.

An altered or component substituted hydraulic system may malfunction, resulting in the tilt deck falling without warning.

NEVER alter or substitute any hydraulic system component.

The raised tilt deck MUST be supported by the prop before entering the area under the tilt deck for any reason. Empty the trailer before using prop.

### DANGER

Crushing hazard.

NEVER enter the area under the trailer unless the trailer is empty and supported by the deck prop.

### WARNING

Risk of death by crushing.

Tilt deck can drop unexpectedly.

NEVER go under a raised tilt deck.

Use prop for maintenance.

1.2.16 Hazards From Modifying Your Trailer

Essential safety items and structural integrity can be damaged by altering your trailer.

Before making any alteration to your trailer, contact your dealer or Featherlite, Inc. at 800-800-1230 and describe the alteration you are contemplating. Alteration of the trailer structure or modification of mechanical, electrical, hydraulic or other systems on your trailer must be performed only by qualified technicians who are familiar with the system as installed on your trailer.
Section 1 - Safety Information

the right (counter-clockwise, as you would do to turn the tow vehicle to the left when moving forward), the rear of the trailer moves to the right. Conversely, rotating the steering wheel clockwise with your hands at the bottom of the wheel will move the rear of the trailer to the left, while backing up. If you are towing a bumper hitch rig, be careful not to allow the trailer to turn too much, because it will hit the rear of the tow vehicle. To straighten the rig, either pull forward, or turn the steering wheel in the opposite direction.

1.2.18 Safe Trailer Towing Guidelines

- Recheck the load tie downs to make sure the load will not shift during towing.
- Before towing, check coupling, safety chain, safety brake, tires, wheels and lights.
- Check the lug nuts or bolts for tightness.
- Check coupler tightness after towing 50 miles.
- Adjust the brake controller to engage the trailer brakes before the tow vehicle brakes. Your dealer can assist you by making this adjustment.
- Use your mirrors to verify that you have room to change lanes or pull into traffic.
- Use your turn signals well in advance.
- Allow plenty of stopping space for your trailer and tow vehicle.
- Do not drive so fast that the trailer begins to sway due to speed. Never drive faster than 60 m.p.h.
- Allow plenty of room for passing. A rule of thumb is that the passing distance with a trailer is 4 times the passing distance without a trailer.
- Shift your automatic transmission into a lower gear for city driving.
- Use lower gears for climbing and descending grades.
- Do not ride the brakes while descending grades, they may get so hot that they stop working. Then you will potentially have a runaway tow vehicle and trailer.
- To conserve fuel, don't use full throttle to climb a hill. Instead, build speed on the approach.
- Slow down for bumps in the road. Take your foot off the brake when crossing the bump.
- Do not brake while in a curve unless absolutely necessary. Instead, slow down before you enter the curve and power through the curve. This way, the towing vehicle remains “in charge.”
- Do not apply the brakes to correct extreme trailer swaying. The application of the trailer brakes alone will tend to straighten out the combination, especially when going downhill.
- Make regular stops, about once each hour. Confirm that
  - the coupler is secure to the hitch and is locked,
  - electrical connectors are made,
  - there is appropriate slack in the safety chains,
  - there is appropriate slack in the breakaway switch pullpin lanyard,
  - the tires are not visibly low on pressure, and
  - the cargo is secure and in good condition.
1.2.19 Safety Warning Labels on Your Trailer

Warning Labels and Locations – Gooseneck Trailer – Figure 1-2

Warning Labels and Locations – Bumper Pull Trailer – Figure 1-3

Warning Labels and Locations – Dump Trailer – Figure 1-4
1.2.20 Reporting Safety Defects

If you believe that your vehicle has a defect that could cause a crash or could cause injury or death, you should immediately inform the National Highway Traffic Safety Administration (NHTSA) in addition to notifying us.

If NHTSA receives similar complaints, it may open an investigation, and if it finds that a safety defect exists in a group of vehicles, it may order a recall and remedy campaign. However, NHTSA cannot become involved in individual problems between you, your dealer, or us.

To contact NHTSA, you may either call the Vehicle Safety Hotline toll-free at 1-888-327-4236 (TTY: 1-800-424-9153), go to http://www.safercar.gov; or write to: Administrator, NHTSA1200 New Jersey Ave., SE, Washington, DC 20590. You can also obtain other information about motor vehicle safety from http://www.safercar.gov.

Call 800-800-1230 to reach Featherlite, Inc.
This portion of the User’s Manual contains tire safety information as required by 49 CFR 575.6.

Section 2.1 contains “Trailer Tire Information”

Section 2.2 contains “Steps for Determining Correct Load Limit - Trailer”.

Section 2.3 contains “Steps for Determining Correct Load Limit – Tow Vehicle”.

Section 2.4 contains a Glossary of Tire Terminology, including “cold inflation pressure”, “maximum inflation pressure”, “recommended inflation pressure”, and other non-technical terms.

Section 2.5 contains information from the NHTSA brochure entitled “Tire Safety – Everything Rides On It”. This brochure, as well as the preceding subsections, describe the following items:

- Tire labeling, including a description and explanation of each marking on the tires, and information about the DOT Tire Identification Number (TIN).
- Recommended tire inflation pressure, including a description and explanation of:
  - Cold inflation pressure.
  - Vehicle Placard and location on the vehicle.
  - Adverse safety consequences of under inflation (including tire failure).
  - Measuring and adjusting air pressure for proper inflation.
- Tire Care, including maintenance and safety practices.
- Vehicle load limits, including a description and explanation of the following items:
  - Locating and understanding the load limit information, total load capacity, and cargo capacity.
  - Calculating total and cargo capacities with varying seating configurations including quantitative examples showing/illustrating how the vehicles cargo and luggage capacity decreases as combined number and size of occupants’ increases. This item is also discussed in Section 3.
  - Determining compatibility of tire and vehicle load capabilities.
  - Adverse safety consequences of overloading on handling and stopping on tires.

2.1 TRAILER TIRE INFORMATION

Trailer tires may be worn out even though they still have plenty of tread left. This is because trailer tires have to carry a lot of weight all the time, even when not in use. It is actually better for the tire to be rolling down the road than to be idle. During use, the tire releases lubricants that are beneficial to tire life. Using the trailer tires often also helps prevent flat spots from developing.

The main cause of tire failure is improper inflation. Check the cold tire inflation pressures at least once a week for proper inflation levels. “Cold” means that the tires are at the same temperature as the surrounding air, such as when the vehicle has been parked overnight. Wheel and tire manufacturers recommend adjusting the air pressure to the trailer manufacturer’s recommended cold inflation pressure, in pounds per square inch (PSI) stated on the vehicle’s Federal Certification Label or Tire Placard when the trailer is loaded to its gross vehicle weight rating (GVWR). If the tires are inflated to less than the recommended inflation level or the GVWR of the trailer is exceeded, the load carrying capacity of the tire could be dramatically affected. If the tires are inflated more than the recommended inflation level, handling characteristics of the tow vehicle/trailer combination could be affected. Refer to the owner’s manual or talk to your dealer or vehicle manufacturer if you have any questions regarding proper inflation practices.

Tires can lose air over a period of time. In fact, tires can lose 1 to 3 PSI per month. This is because molecules of air, under pressure, weave their way from the inside of the tire, through the rubber, to the outside. A drop in tire pressure could cause the tire to become overloaded, leading to excessive heat build up. If a trailer tire is under-inflated, even for a short period of time, the tire could suffer internal damage.
High speed towing in hot conditions degrades trailer tires significantly. As heat builds up during driving, the tire’s internal structure starts to breakdown, compromising the strength of the tire. It is recommended to drive at moderate speeds.

Statistics indicate the average life of a trailer tire is about five years under normal use and maintenance conditions. After three years, replacing the trailer tires with new ones should be considered, even if the tires have adequate tread depth. Some experts claim that after five years, trailer tires are considered worn out and should be replaced, even if they have had minimal or no use. This is such a general statement that it may not apply in all cases. It is best to have your tires inspected by a tire supplier to determine if your tires need to be replaced.

If you are storing your trailer for an extended period, make sure the tires are fully inflated to the maximum rated pressure and that you store them in a cool, dry place, such as a garage. Use tire covers to protect the trailer tires from the harsh effects of the sun.

2.2 STEPS FOR DETERMINING CORRECT LOAD LIMIT – TRAILER

Determining the load limits of a trailer includes more than understanding the load limits of the tires alone. On all trailers there is a Federal Certification / VIN label that is located on the forward half of the left (road) side of the unit. This certification/VIN label will indicate the trailer’s Gross Vehicle Weight Rating (GVWR). This is the most weight the fully loaded trailer can weigh. It will also provide the Gross Axle Weight Rating (GAWR). This is the most a particular axle can weigh. If there are multiple axles, the GAWR of each axle will be provided.

If your trailer has a GVWR of 10,000 pounds or less, there is a vehicle placard located in the same location as the certification label described above. This placard provides tire and loading information. In addition, this placard will show a statement regarding maximum cargo capacity. Cargo can be added to the trailer, up to the maximum weight specified on the placard. The combined weight of the cargo is provided as a single number. In any case, remember: the total weight of a fully loaded trailer can not exceed the stated GVWR.

For trailers with living quarters installed, the weight of water and propane also need to be considered. The weight of fully filled propane containers is considered part of the weight of the trailer before it is loaded with cargo, and is not considered part of the disposable cargo load. Water however, is a disposable cargo weight and is treated as such. If there is a fresh water storage tank of 100 gallons, this tank when filled would weigh about 800 pounds. If more cargo is being transported, water can be off-loaded to keep the total amount of cargo added to the vehicle within the limits of the GVWR so as not to overload the vehicle. Understanding this flexibility will allow you, the owner, to make choices that fit your travel needs.

When loading your cargo, be sure it is distributed evenly to prevent overloading front to back and side to side. Heavy items should be placed low and as close to the axle positions as reasonable. Too many items on one side may overload a tire. The best way to know the actual weight of the vehicle is to weigh it at a public scale. Talk to your dealer to discuss the weighing methods needed to capture the various weights related to the trailer. This would include the weight empty or unloaded, weights per axle, wheel, hitch or king-pin, and total weight.

Excessive loads and/or underinflation cause tire overloading and, as a result, abnormal tire flexing occurs. This situation can generate an excessive amount of heat within the tire. Excessive heat may lead to tire failure. It is the air pressure that enables a tire to support the load, so proper inflation is critical. The proper air pressure may be found on the Certification / VIN label and/or on the Tire Placard. This value should never exceed the maximum cold inflation pressure stamped on the tire.

2.2.1 Trailers 10,000 Pounds GVWR or Less

![Tire Information Placard – Figure 2-1](image)
Section 2 - Tire Safety Information

1. Locate the statement, “The weight of cargo should never exceed XXX kg or XXX lbs.,” on your vehicle’s placard. See figure 2-1.
2. This figure equals the available amount of cargo and luggage load capacity.
3. Determine the combined weight of luggage and cargo being loaded on the vehicle. That weight may not safely exceed the available cargo and luggage load capacity.

The trailer’s placard refers to the Tire Information Placard attached adjacent to or near the trailer’s VIN (Certification) label at the left front of the trailer.

2.2.2 Trailers Over 10,000 Pounds GVWR

Note: These trailers are not required to have a tire information placard on the trailer and may not have one installed.
1. Determine the empty weight of your trailer by weighing the trailer using a public scale or other means. This step does not have to be repeated.
2. Locate the GVWR (Gross Vehicle Weight Rating) of the trailer on your trailer’s VIN (Certification) label.
3. Subtract the empty weight of your trailer from the GVWR stated on the VIN label. That weight is the maximum available cargo capacity of the trailer and may not be safely exceeded.

2.3 STEPS FOR DETERMINING CORRECT LOAD LIMIT – TOW VEHICLE

1. Locate the statement, “The combined weight of occupants and cargo should never exceed XXX lbs.,” on your vehicle’s placard.
2. Determine the combined weight of the driver and passengers who will be riding in your vehicle.
3. Subtract the combined weight of the driver and passengers from XXX kilograms or XXX pounds.
4. The resulting figure equals the available amount of cargo and luggage capacity. For example, if the “XXX” amount equals 1400 lbs. and there will be five 150 lb. passengers in your vehicle, the amount of available cargo and luggage capacity is 650 lbs. (1400-750 (5 x 150) = 650 lbs.).
5. Determine the combined weight of luggage and cargo being loaded on the vehicle. That weight may not safely exceed the available cargo and luggage capacity calculated in Step # 4.
6. If your vehicle will be towing a trailer, load from your trailer will be transferred to your vehicle. Consult the tow vehicle’s manual to determine how this weight transfer reduces the available cargo and luggage capacity of your vehicle.

2.4 GLOSSARY OF TIRE TERMINOLOGY

Accessory weight
The combined weight (in excess of those standard items which may be replaced) of automatic transmission, power steering, power brakes, power windows, power seats, radio and heater, to the extent that these items are available as factory-installed equipment (whether installed or not).

Bead
The part of the tire that is made of steel wires, wrapped or reinforced by ply cords and that is shaped to fit the rim.

Bead separation
This is the breakdown of the bond between components in the bead.

Bias ply tire
A pneumatic tire in which the ply cords that extend to the beads are laid at alternate angles substantially less than 90 degrees to the centerline of the tread.

Carcass
The tire structure, except tread and sidewall rubber which, when inflated, bears the load.

Chunking
The breaking away of pieces of the tread or sidewall.

Cold inflation pressure
The pressure in the tire before you drive.

Cord
The strands forming the plies in the tire.

Cord separation
The parting of cords from adjacent rubber compounds.

Cracking
Any parting within the tread, sidewall, or inner liner of the tire extending to cord material.
CT
A pneumatic tire with an inverted flange tire and rim system in which the rim is designed with rim flanges pointed radially inward and the tire is designed to fit on the underside of the rim in a manner that encloses the rim flanges inside the air cavity of the tire.

Curb weight
The weight of a motor vehicle with standard equipment including the maximum capacity of fuel, oil, and coolant, and, if so equipped, air conditioning and additional weight optional engine.

Extra load tire
A tire designed to operate at higher loads and at higher inflation pressures than the corresponding standard tire.

Groove
The space between two adjacent tread ribs.

Gross Axle Weight Rating
The maximum weight that any axle can support, as published on the Certification / VIN label on the front left side of the trailer. Actual weight determined by weighing each axle on a public scale, with the trailer attached to the towing vehicle.

Gross Vehicle Weight Rating
The maximum weight of the fully loaded trailer, as published on the Certification / VIN label. Actual weight determined by weighing trailer on a public scale, without being attached to the towing vehicle.

Hitch Weight
The downward force exerted on the hitch ball by the trailer coupler.

Innerliner
The layer(s) forming the inside surface of a tubeless tire that contains the inflating medium within the tire.

Innerliner separation
The parting of the innerliner from cord material in the carcass.

Intended outboard sidewall
The sidewall that contains a white-wall, bears white lettering or bears manufacturer, brand, and/or model name molding that is higher or deeper than the same molding on the other sidewall of the tire or the outward facing sidewall of an asymmetrical tire that has a particular side that must always face outward when mounted on a vehicle.

Light truck (LT) tire
A tire designated by its manufacturer as primarily intended for use on lightweight trucks or multipurpose passenger vehicles. May be used on trailers.

Load rating
The maximum load that a tire is rated to carry for a given inflation pressure.

Maximum load rating
The load rating for a tire at the maximum permissible inflation pressure for that tire.

Maximum permissible inflation pressure
The maximum cold inflation pressure to which a tire may be inflated.

Maximum loaded vehicle weight
The sum of curb weight, accessory weight, vehicle capacity weight, and production options weight.

Measuring rim
The rim on which a tire is fitted for physical dimension requirements.

Non-pneumatic rim
A mechanical device which, when a non-pneumatic tire assembly incorporates a wheel, supports the tire, and attaches, either integrally or separably, to the wheel center member and upon which the tire is attached.

Non-pneumatic spare tire assembly
A non-pneumatic tire assembly intended for temporary use in place of one of the pneumatic tires and rims that are fitted to a passenger car in compliance with the requirements of this standard.

Non-pneumatic tire
A mechanical device which transmits, either directly or through a wheel or wheel center member, the vertical load and tractive forces from the roadway to the vehicle, generates the tractive forces that provide the directional control of the vehicle and does not rely on the containment of any gas or fluid for providing those functions.
Section 2 - Tire Safety Information

Non-pneumatic tire assembly
A non-pneumatic tire, alone or in combination with a wheel or wheel center member, which can be mounted on a vehicle.

Normal occupant weight
This means 68 kilograms (150 lbs.) times the number of occupants specified in the second column of Table I of 49 CFR 571.110.

Occupant distribution
The distribution of occupants in a vehicle as specified in the third column of Table I of 49 CFR 571.110.

Open splice
Any parting at any junction of tread, sidewall, or innerliner that extends to cord material.

Outer diameter
The overall diameter of an inflated new tire.

Overall width
The linear distance between the exteriors of the sidewalls of an inflated tire, including elevations due to labeling, decorations, or protective bands or ribs.

Pin Weight
The downward force applied to the 5th wheel or gooseneck ball, by the trailer kingpin or gooseneck coupler.

Ply
A layer of rubber-coated parallel cords.

Ply separation
A parting of rubber compound between adjacent plies.

Pneumatic tire
A mechanical device made of rubber, chemicals, fabric and steel or other materials, that, when mounted on an automotive wheel, provides the traction and contains the gas or fluid that sustains the load.

Production options weight
The combined weight of those installed regular production options weighing over 2.3 kilograms (5 lbs.) in excess of those standard items which they replace, not previously considered in curb weight or accessory weight, including heavy duty brakes, ride levelers, roof rack, heavy duty battery, and special trim.

Radial ply tire
A pneumatic tire in which the ply cords that extend to the beads are laid at substantially 90 degrees to the centerline of the tread.

Recommended inflation pressure
This is the inflation pressure provided by the vehicle manufacturer on the Tire Information label and on the Certification / VIN tag.

Reinforced tire
A tire designed to operate at higher loads and at higher inflation pressures than the corresponding standard tire.

Rim
A metal support for a tire or a tire and tube assembly upon which the tire beads are seated.

Rim diameter
This means the nominal diameter of the bead seat.

Rim size designation
This means the rim diameter and width.

Rim type designation
This means the industry of manufacturer’s designation for a rim by style or code.

Rim width
This means the nominal distance between rim flanges.

Section width
The linear distance between the exteriors of the sidewalls of an inflated tire, excluding elevations due to labeling, decoration, or protective bands.

Sidewall
That portion of a tire between the tread and bead.

Sidewall separation
The parting of the rubber compound from the cord material in the sidewall.

Special Trailer (ST) tire
The "ST" is an indication the tire is for trailer use only.
Section 2 - Tire Safety Information

Test rim
The rim on which a tire is fitted for testing, and may be any rim listed as appropriate for use with that tire.

Tread
That portion of a tire that comes into contact with the road.

Tread rib
A tread section running circumferentially around a tire.

Tread separation
Pulling away of the tread from the tire carcass.

Treadwear indicators (TWI)
The projections within the principal grooves designed to give a visual indication of the degrees of wear of the tread.

Vehicle capacity weight
The rated cargo and luggage load plus 68 kilograms (150 lbs.) times the vehicle’s designated seating capacity.

Vehicle maximum load on the tire
The load on an individual tire that is determined by distributing to each axle its share of the maximum loaded vehicle weight and dividing by two.

Vehicle normal load on the tire
The load on an individual tire that is determined by distributing to each axle its share of the curb weight, accessory weight, and normal occupant weight (distributed in accordance with Table I of CRF 49 571.110) and dividing by 2.

Weather side
The surface area of the rim not covered by the inflated tire.

Wheel center member
In the case of a non-pneumatic tire assembly incorporating a wheel, a mechanical device which attaches, either integrally or separably, to the non-pneumatic rim and provides the connection between the non-pneumatic rim and the vehicle; or, in the case of a non-pneumatic tire assembly not incorporating a wheel, a mechanical device which attaches, either integrally or separably, to the non-pneumatic tire and provides the connection between tire and the vehicle.

Wheel-holding fixture
The fixture used to hold the wheel and tire assembly securely during testing.

2.5 Tire Safety - Everything Rides On It
The National Traffic Safety Administration (NHTSA) has published a brochure (DOT HS 809 361) that discusses all aspects of Tire Safety, as required by CFR 575.6. This brochure is reproduced in part below. It can be obtained and downloaded from NHTSA, free of charge, from the following web site:

Studies of tire safety show that maintaining proper tire pressure, observing tire and vehicle load limits (not carrying more weight in your vehicle than your tires or vehicle can safely handle), avoiding road hazards, and inspecting tires for cuts, slashes, and other irregularities are the most important things you can do to avoid tire failure, such as tread separation or blowout and flat tires. These actions, along with other care and maintenance activities, can also:

- Improve vehicle handling
- Help protect you and others from avoidable breakdowns and accidents
- Improve fuel economy
- Increase the life of your tires.

This booklet presents a comprehensive overview of tire safety, including information on the following topics:

- Basic tire maintenance
- Uniform Tire Quality Grading System
- Fundamental characteristics of tires
- Tire safety tips.

Use this information to make tire safety a regular part of your vehicle maintenance routine. Recognize that the time you spend is minimal compared with the inconvenience and safety consequences of a flat tire or other tire failure.

2.5.1 Safety First–Basic Tire Maintenance
Properly maintained tires improve the steering, stopping, traction, and load-carrying capability of your vehicle. Underinflated tires and overloaded vehicles are a major cause of tire failure. Therefore,
as mentioned above, to avoid flat tires and other
types of tire failure, you should maintain proper tire
pressure, observe tire and vehicle load limits, avoid
road hazards, and regularly inspect your tires.

2.5.2 Finding Your Vehicle's
Recommended Tire Pressure and
Load Limits

Tire information placards and vehicle certification
labels contain information on tires and load limits. These labels indicate the vehicle manufacturer's information including:

- Recommended tire size
- Recommended tire inflation pressure
- Vehicle capacity weight (VCW— the maximum
  occupant and cargo weight a vehicle is
designed to carry)
- Front and rear gross axle weight ratings
  (GAWR— the maximum weight the axle
  systems are designed to carry).

Both placards and certification labels are
permanently attached to the trailer near the left
front.

2.5.3 Understanding Tire Pressure and
Load Limits

Tire inflation pressure is the level of air in the tire
that provides it with load-carrying capacity and
affects the overall performance of the vehicle. The
tire inflation pressure is a number that indicates the
amount of air pressure— measured in pounds per
square inch (psi)— a tire requires to be properly
inflated. (You will also find this number on the
vehicle information placard expressed in kilopascals
(kPa), which is the metric measure used
internationally.)

Manufacturers of passenger vehicles and light
trucks determine this number based on the vehicle's
design load limit, that is, the greatest amount of
weight a vehicle can safely carry and the vehicle's
tire size. The proper tire pressure for your vehicle
is referred to as the "recommended cold inflation
pressure." (As you will read below, it is difficult to
obtain the recommended tire pressure if your tires
are not cold.)

Because tires are designed to be used on more than
one type of vehicle, tire manufacturers list the
"maximum permissible inflation pressure" on the
tire sidewall. This number is the greatest amount of
air pressure that should ever be put in the tire under
normal driving conditions.

2.5.4 Checking Tire Pressure

It is important to check your vehicle's tire pressure
at least once a month for the following reasons:

- Most tires may naturally lose air over time.
- Tires can lose air suddenly if you drive over a
  pothole or other object or if you strike the curb
  when parking.
- With radial tires, it is usually not possible to
determine underinflation by visual inspection.

For convenience, purchase a tire pressure gauge to
keep in your vehicle. Gauges can be purchased at
tire dealerships, auto supply stores, and other retail
outlets.

The recommended tire inflation pressure that
vehicle manufacturers provide reflects the proper
psi when a tire is cold. The term cold does not relate
to the outside temperature. Rather, a cold tire is one
that has not been driven on for at least three hours.
When you drive, your tires get warmer, causing the
air pressure within them to increase. Therefore, to
get an accurate tire pressure reading, you must
measure tire pressure when the tires are cold or
compensate for the extra pressure in warm tires.

2.5.5 Steps for Maintaining Proper Tire
Pressure

- Step 1: Locate the recommended tire pressure
  on the vehicle's tire information placard,
certification label, or in the owner's manual.
- Step 2: Record the tire pressure of all tires.
- Step 3: If the tire pressure is too high in any of
  the tires, slowly release air by gently pressing
  on the tire valve stem with the edge of your tire
gauge until you get to the correct pressure.
- Step 4: If the tire pressure is too low, note
  the difference between the measured tire pressure
  and the correct tire pressure. These "missing"
pounds of pressure are what you will need to
add.
- Step 5: At a service station, add the missing
  pounds of air pressure to each tire that is
underinflated.
- Step 6: Check all the tires to make sure they
  have the same air pressure (except in cases in
  which the front and rear tires are supposed to
  have different amounts of pressure).

If you have been driving your vehicle and think that
a tire is underinflated, fill it to the recommended
cold inflation pressure indicated on your vehicle's
tire information placard or certification label. While your tire may still be slightly underinflated due to the extra pounds of pressure in the warm tire, it is safer to drive with air pressure that is slightly lower than the vehicle manufacturer's recommended cold inflation pressure than to drive with a significantly underinflated tire. Since this is a temporary fix, don't forget to recheck and adjust the tire's pressure when you can obtain a cold reading.

2.5.6 Tire Size

To maintain tire safety, purchase new tires that are the same size as the vehicle's original tires or another size recommended by the manufacturer. Look at the tire information placard, the owner's manual, or the sidewall of the tire you are replacing to find this information. If you have any doubt about the correct size to choose, consult with the tire dealer.

2.5.7 Tire Tread

The tire tread provides the gripping action and traction that prevent your vehicle from slipping or sliding, especially when the road is wet or icy. In general, tires are not safe and should be replaced when the tread is worn down to 1/16 of an inch. Tires have built-in treadwear indicators that let you know when it is time to replace your tires. These indicators are raised sections spaced intermittently in the bottom of the tread grooves. When they appear "even" with the outside of the tread, it is time to replace your tires. Another method for checking tread depth is to place a penny in the tread with Lincoln's head upside down and facing you. If you can see the top of Lincoln's head, you are ready for new tires.

2.5.8 Tire Balance and Wheel Alignment

To avoid vibration or shaking of the vehicle when a tire rotates, the tire must be properly balanced. This balance is achieved by positioning weights on the wheel to counterbalance heavy spots on the wheel-and-tire assembly. A wheel alignment adjusts the angles of the wheels so that they are positioned correctly relative to the vehicle's frame. This adjustment maximizes the life of your tires. These adjustments require special equipment and should be performed by a qualified technician.

2.5.9 Tire Repair

The proper repair of a punctured tire requires a plug for the hole and a patch for the area inside the tire that surrounds the puncture hole. Punctures through the tread can be repaired if they are not too large, but punctures to the sidewall should not be repaired. Tires must be removed from the rim to be properly inspected before being plugged and patched.

2.5.10 Tire Fundamentals

Federal law requires tire manufacturers to place standardized information on the sidewall of all tires. This information identifies and describes the fundamental characteristics of the tire and also provides a tire identification number for safety standard certification and in case of a recall.

2.5.10.a Information on Passenger Vehicle Tires

Please refer to the diagram below.

P
The "P" indicates the tire is for passenger vehicles.

Next number
This three-digit number gives the width in millimeters of the tire from sidewall edge to sidewall edge. In general, the larger the number, the wider the tire.

Next number
This two-digit number, known as the aspect ratio, gives the tire's ratio of height to width. Numbers of 70 or lower indicate a short sidewall for improved steering response and better overall handling on dry pavement.

R
The "R" stands for radial. Radial ply construction of tires has been the industry standard for the past 20 years.
Next number
This two-digit number is the wheel or rim diameter in inches. If you change your wheel size, you will have to purchase new tires to match the new wheel diameter.

Next number
This two- or three-digit number is the tire's load index. It is a measurement of how much weight each tire can support. You may find this information in your owner's manual. If not, contact a local tire dealer. Note: You may not find this information on all tires because it is not required by law.

M+S
The "M+S" or "M/S" indicates that the tire has some mud and snow capability. Most radial tires have these markings; hence, they have some mud and snow capability.

Speed Rating
The speed rating denotes the speed at which a tire is designed to be driven for extended periods of time. Note: You may not find this information on all tires because it is not required by law.

U.S. DOT Tire Identification Number
This begins with the letters "DOT" and indicates that the tire meets all federal standards. The next two numbers or letters are the plant code where it was manufactured, and the last four numbers represent the week and year the tire was built. For example, the numbers 3197 means the 31st week of 1997. The other numbers are marketing codes used at the manufacturer's discretion. This information is used to contact consumers if a tire defect requires a recall.

Tire Ply Composition and Materials Used
The number of plies indicates the number of layers of rubber-coated fabric in the tire. In general, the greater the number of plies, the more weight a tire can support. Tire manufacturers also must indicate the materials in the tire, which include steel, nylon, polyester, and others.

Maximum Load Rating
This number indicates the maximum load in kilograms and pounds that can be carried by the tire.

Maximum Permissible Inflation Pressure
This number is the greatest amount of air pressure that should ever be put in the tire under normal driving conditions.

2.5.10.b UTQGS Information

Treadwear Number
This number indicates the tire's wear rate. The higher the treadwear number is, the longer it should take for the tread to wear down. For example, a tire graded 400 should last twice as long as a tire graded 200.

Traction Letter
This letter indicates a tire's ability to stop on wet pavement. A higher graded tire should allow you to stop your car on wet roads in a shorter distance than a tire with a lower grade. Traction is graded from highest to lowest as "AA", "A", "B", and "C".

Temperature Letter
This letter indicates a tire's resistance to heat. The temperature grade is for a tire that is inflated properly and not overloaded. Excessive speed, underinflation or excessive loading, either separately or in combination, can cause heat buildup and possible tire failure. From highest to lowest, a tire's resistance to heat is graded as "A", "B", or "C".

2.5.10.c Information on Light Truck (LT) Tires

Please refer to the following diagram.

Tires for light trucks have other markings besides those found on the sidewalls of passenger tires.
Section 2 – Tire Safety Information

LT
The "LT" indicates the tire is for light trucks or trailers.

Max. Load Dual kg (lbs) at kPa (psi) Cold
This information indicates the maximum load and tire pressure when the tire is used as a dual, that is, when four tires are put on each rear axle (a total of six or more tires on the vehicle).

Max. Load Single kg (lbs) at kPa (psi) Cold
This information indicates the maximum load and tire pressure when the tire is used as a single.

Load Range
This information identifies the tire's load-carrying capabilities and its inflation limits.

2.5.10.d Information on Special Trailer (ST) Tires

Please refer to the following diagram.

Max. Load Dual kg (lbs) at kPa (psi) Cold
This information indicates the maximum load and tire pressure when the tire is used as a dual, that is, when four tires are put on each rear axle (a total of six or more tires on the vehicle).

Max. Load Single kg (lbs) at kPa (psi) Cold
This information indicates the maximum load and tire pressure when the tire is used as a single.

Load Range
This information identifies the tire's load-carrying capabilities and its inflation limits.

2.5.11 Tire Safety Tips

Preventing Tire Damage

• Slow down if you have to go over a pothole or other object in the road.
• Do not run over curbs or other foreign objects in the roadway, and try not to strike the curb when parking.

Tire Safety Checklist

• Check tire pressure regularly (at least once a month), including the spare.
• Inspect tires for uneven wear patterns on the tread, cracks, foreign objects, or other signs of wear or trauma.
• Remove bits of glass and foreign objects wedged in the tread.
• Make sure your tire valves have valve caps.
• Check tire pressure before going on a long trip.
• Do not overload your vehicle. Check the tire information placard or owner’s manual for the maximum recommended load for the vehicle.
3 COUPLING TO THE TOW VEHICLE

This manual provides instructions for the operation and care of Featherlite Open Trailers. The instructions in the manual must be followed to ensure safety and satisfactory life of the trailer. Safety precautions to protect against injury or property damage must be followed at all times.

This section of the manual is organized into the following subsections:
- Using an adequate tow vehicle and hitch
- Coupling the trailer to the tow vehicle
- Loading the trailer
- Checking the trailer for safety before each tow
- Breaking in a new trailer
- Synchronizing the brakes
- Uncoupling the trailer

Trailer Accessories

Featherlite offers trailers with a wide range of accessories. Instructions for safe use of these accessories are located in separate instruction manuals, some of which are provided by the accessory manufacturer.

Section 7 of this manual contains instructions regarding the use of some accessory items, such as:
- Accessory Battery
- Electric-powered hydraulic landing gear

Your Featherlite trailer has been built using parts from various component manufacturers. Where this manual indicates that you should read another manual, and you do not have that manual, call Featherlite at 1-800-800-1230 for assistance.

3.1 USE AN ADEQUATE TOW VEHICLE AND HITCH

If the tow vehicle or hitch is not properly selected and matched to the Gross Vehicle Weight Rating (GVWR) of your trailer, you can cause an accident that could lead to death or serious injury. Tow vehicle and hitch manufacturers are the appropriate source of competent advice.

If you already have a tow vehicle, know your vehicle tow rating and make certain the trailer’s rated capacity is less than or equal to the tow vehicle’s rated towing capacity.

DANGER

Use of an under-rated hitch, ball or tow vehicle can result in loss of control leading to death or serious injury.

Make certain your hitch and tow vehicle are rated for your trailer.

3.1.1 Trailer Information

The “Trailer Certification (VIN) Tag” location figure shows the location of the Certification / Vehicle Identification Number (VIN) tag on your trailer. See figure 3-1 or 3-2.

Gooseneck Certification (VIN) Tag Location - Figure 3-1

Bumper Pull Certification (VIN) Tag Location - Figure 3-2

The trailer Certification (VIN) tag contains the following critical safety information for the use of your trailer:
Section 3 - Coupling To The Tow Vehicle

MANUFACTURER: Name of trailer manufacturer

DATE OF MANUFACTURE: Month and year the trailer was manufactured.

GAWR: The Gross Axle Weight Rating is the maximum gross weight that an axle can support. It is the lowest of axle, wheel, or tire rating. Sometimes the tire or wheel rating is lower than the axle manufacturers rating, and will then determine GAWR.

GVWR: The Gross Vehicle Weight Rating is the maximum allowable gross weight of the trailer and its contents. The gross weight of the trailer includes the weight of the trailer and all of the items within it (such as cargo, water, food and other supplies). GVWR is sometimes referred to as GTW (Gross Trailer Weight), or MGTW (Maximum Gross Trailer Weight). GVWR, GTW and MGTW are all the same rating.

The sum total of the GAWR for all trailer axles may be less than the GVWR for the trailer, because some of the trailer load is carried by the tow vehicle, rather than by the trailer axle(s). The total weight of the cargo and trailer must not exceed the GVWR, and the load on an axle must not exceed its GAWR.

PSIC: The “pounds per square inch-cold” is the tire pressure (Kilopascals / Pounds per Square Inch) measured when Cold.

VIN: The Vehicle Identification Number.

VEHICLE TYPE: Trailer plus the model number of the trailer.

Certification Statement: “This trailer meets all the Federal Motor Vehicle Safety Standards in effect on the date of manufacture shown above.”

There are two additional weights that are not provided on the Certification (VIN) tag that are important, and that should be put somewhere on the trailer. These are the “empty weight” and “maximum cargo weight”.

The “empty weight” is sometimes put on the Manufacturer’s Certificate of Origin (Title) but may not be accurate for your particular trailer, due to accessories, optional equipment, etc. The best way to determine empty weight is to weigh the entire trailer on a “Certified” scale at a truck stop. This requires detaching the trailer and leaving the entire trailer on the scale. Furthermore, it is desirable to weigh the tongue weight. This can be done by re-attaching the trailer to the tow vehicle, after getting the empty weight, and then just weighing the trailer axles(s). Subtracting the axle weight from the empty weight gives you the tongue weight.

Knowing the empty weight now allows you to calculate the “maximum cargo weight”. Simply subtract the empty weight from the GVWR shown on the Certification / VIN tag.

While you’re at the scale it is also a good idea to weigh the towing vehicle, with driver, in the typical towing scenario. This will provide you with the total “combination vehicle weight”, which can then be compared to the allowable Gross Combined Weight Rating (GCWR) provided by the tow vehicle manufacturer, as discussed below.

3.1.2 Tow Vehicle

When equipping a new vehicle or an older vehicle to tow your trailer, ask the vehicle dealer for advice on how to outfit the towing vehicle. Discuss the following information and equipment with the vehicle dealer.

Overall Carrying and Towing Capacity of Vehicle: Vehicle manufacturers will provide you with the maximum towing capacities of their various models, as well as the GCWR. No amount of reinforcement will give a 100 horsepower, 2,500 pound truck the towing capacity that a 300 horsepower, 5,000 pound truck has.

Towing Hitch: The towing hitch attached to your tow vehicle must have a capacity equal to or greater than the load rating of the trailer you intend to tow. The hitch capacity must also be matched to the tow vehicle capacity.

Suspension System: A tow vehicle equipped with a factory installed “Towing Package” likely comes equipped with heavy duty springs, heavy duty tires and other suspension components which are able to serve the size and weight of the trailer that the vehicle is rated to tow. However, the addition of
additional equipment may further improve the tow vehicle performance. These may include adjustable air shocks, helper springs, etc.

**Brake Controller:** The brake controller is part of the tow vehicle and is essential in the operation of the electric brakes on the trailer. If your trailer has electric brakes it requires a brake controller be installed at the driver’s position. The brake controller is not the same as the safety breakaway brake system that is installed on the trailer.

**Side View Mirrors:** The size of the trailer that is being towed and your state law regulations determine the size of the mirrors. However, some states prohibit extended mirrors on a tow vehicle, except while a trailer is actually being towed. In this situation, detachable extended mirrors are necessary. Check with your dealer or the appropriate state agency for mirror requirements.

**Heavy Duty Flasher:** A Heavy Duty Flasher is an electrical component that may be required when your trailer turn signal lights are attached to the tow vehicle master circuit.

**Electrical Connector:** An Electrical Connector connects the light and brake systems on the trailer to the light and brake controls on the towing vehicle.

**Heavy Duty Engine Oil Cooling System:** The tow vehicle engine works harder when a trailer is being towed. Depending on the size of the trailer, you may need to install a separate engine oil cooler. Inadequate cooling may result in sudden engine failure. Ask the tow vehicle dealer if it is necessary to install a heavy duty cooling system.

**Automatic Transmission Oil Cooler:** The automatic transmission of a towing vehicle handles more power when a trailer is being towed. Inadequate cooling will shorten transmission life, and may result in sudden transmission failure. Ask the tow vehicle dealer if it is necessary to install a separate oil cooler for the automatic transmission.

**Fire Extinguisher:** It is sensible to have a fire extinguisher in the tow vehicle.

**Emergency Flares and Emergency Triangle Reflectors:** It is wise to carry these warning devices even if you are not towing a trailer. It is particularly important to have these when towing a trailer because the hazard flashers of your towing vehicle will not operate for as long a period of time when the battery is running both the trailer lights and tow vehicle lights.

### 3.2 COUPLING AND UNCOUPLING THE TRAILER

A secure coupling (or fastening) of the trailer to the tow vehicle is essential. A loss of coupling may result in death or serious injury. Therefore, you must understand and follow all of the instructions for coupling.

The following parts are involved in making a secure coupling between the trailer and tow vehicle:

**Coupling:** That part of the trailer connecting mechanism by which the connection is actually made to the trailer hitch. This does not include any structural member, extension of the trailer frame, or brake controller. (per SAE J684)

**Hitch:** That part of the connecting mechanism including the ball support platform and ball and those components that extend and are attached to the towing vehicle, including bumpers intended to serve as hitches. (per SAE J684)

**Safety chains:** Chains are permanently attached to the trailer such that if the coupler connection comes loose, the safety chains can keep the trailer attached to the tow vehicle. With properly rigged safety chains, it is possible to keep the tongue of the trailer from digging into the road pavement, even if the coupler-to-hitch connection comes apart.

**Trailer lighting (and braking) connector:** A device that connects electrical power from the tow vehicle to the trailer. Electricity is used to turn on brake lights, running lights, and turn signals as required. In addition, if your trailer has a separate braking system, the electrical connector will also supply power to the trailer brakes from the tow vehicle.

**Breakaway switch:** If the trailer becomes decoupled from the towing vehicle, the breakaway switch lanyard, attached independently to the tow vehicle hitch, will pull a pin in the emergency electrical breakaway switch on the trailer. The breakaway switch is activated by a separate battery
Section 3 - Coupling To The Tow Vehicle

supply in the trailer such as to energize the trailer brakes independently of the towing vehicle. It is important to check the state of charge of the emergency breakaway battery before each trip. Simply pull the pin out of the switch by hand and then try to pull the trailer. If you feel a significant drag force the brakes are activated. Be sure to re-insert the pin in the breakaway switch. Also be sure to allow enough slack in the breakaway brake lanyard such that the switch will only activate (pin pulls out) if the coupler connection comes loose.

**Jack:** A device on the trailer that is used to raise and lower the trailer tongue. On larger trailers the jack is sometimes called the “landing gear.”

---

**WARNING**

An improperly coupled trailer can result in death or serious injury.

Do not move the trailer until:
- The coupler is secured and locked;
- The safety chains are secured to the tow vehicle; and
- The trailer jacks are fully retracted.
- Do not tow the trailer on the road until:
  - The trailer brakes are checked;
  - The breakaway switch is connected to the tow vehicle;
  - The load is secured to the trailer; and
  - The trailer lights are connected and checked.

---

**Couplers**

Featherlite Trailers are produced with a variety of coupler devices. One of the sections below will pertain to your trailer.

- Bumper pull (Ball Hitch) Coupler
- Gooseneck Ball Hitch Coupler
- Gooseneck Fifth Wheel Coupler

If the coupler on your trailer does not resemble one of the couplers shown in the figures, see the separate coupler instructions. If you do not have separate coupler instructions, call Featherlite, Inc. at 800-800-1230 for assistance.

---

### 3.2.1 Trailer with Ball Hitch Coupler

A ball hitch coupler connects to a ball that is located on or under the rear bumper of the tow vehicle. This system of coupling a trailer to a tow vehicle is sometimes referred to as “bumper pull.”

A ball hitch trailer may be fitted with a tongue jack that can raise and lower the coupler. The tongue jack is mounted to the A-frame (front, or tongue) part of the trailer. By rotating the jack handle clockwise, the jack will extend and raise the tongue of the trailer. Figure 3-3 shows a trailer with a ball hitch coupler.

---

Be sure the Ball Hitch coupler is suitable for the size and weight of the trailer. The load rating of the coupler and the necessary ball size are listed on the trailer tongue. You must provide a hitch and ball for your tow vehicle, where the load rating of the hitch and ball is equal to or greater than that of your trailer. Also, the ball size must be the same as the coupler size. If the hitch ball is too small, too large, is underrated, is loose or is worn, the trailer can come loose from the tow vehicle, and may cause death or serious injury.

THE TOW VEHICLE, HITCH AND BALL MUST HAVE A RATED TOWING CAPACITY EQUAL TO OR GREATER THAN THE TRAILER Gross Vehicle Weight Rating (GVWR).

IT IS ESSENTIAL THAT THE HITCH BALL BE OF THE SAME SIZE AS THE COUPLER.
Section 3 - Coupling To The Tow Vehicle

IF THE HITCH BALL IS TOO SMALL, IS UNDERRATED, IS LOOSE OR IS WORN, THE TRAILER CAN COME LOOSE FROM THE TOW VEHICLE, RESULTING IN DEATH OR SERIOUS INJURY.

The ball size and load rating (capacity) are marked on the ball; hitch capacity is marked on the hitch.

3.2.1.a Before Coupling the Trailer to the Tow Vehicle

- Be sure the size and rating of hitch ball match the size and rating of the coupler. Hitch balls and couplers are marked with their size and rating.

**WARNING**
Coupler-to-hitch mismatch can result in uncoupling, leading to death or serious injury.
Make sure the hitch and ball are rated for the trailer coupling.
Make sure the hitch [ball size] matches the coupler.

- Wipe the hitch ball clean and inspect it visually and by feel for flat spots, cracks and pits.

**WARNING**
A worn, cracked or corroded hitch ball can fail while towing, and may result in death or serious injury.
Check the hitch ball for wear, corrosion and cracks before coupling the trailer.
Replace worn, corroded or cracked hitch ball before coupling the trailer.

- Rock the ball to make sure it is tight to the hitch, and visually check that the hitch ball nut is solid against the lock washer and hitch frame.
- Wipe the inside and outside of the coupler clean and inspect it visually for cracks and deformations; feel the inside of the coupler for worn spots and pits.
- Be sure the coupler is tight to the tongue of the trailer. All coupler fasteners must be visibly solid against the trailer frame.

3.2.1.b Prepare the Coupler and Hitch

- Lubricate the hitch ball and the inside of the coupler with a thin layer of automotive bearing grease. Using the jack, raise the coupler above the ball height.
- The trailer can be equipped with two different types of couplers. See figures 3-4, 3-5 and 3-6 to determine the type of coupler on your trailer.
- Open the coupler locking mechanism. Ball couplers have a locking mechanism with an internal moving piece (ball clamp) and an outside handle, wheel, or latch. See figures 3-4, 3-5 and 3-6.

- In the open or unlatched position, the coupler is able to drop fully onto the hitch ball.
- See the coupler instructions for details of placing the coupler in the open or unlatched position.

- Slowly back up the tow vehicle so that the hitch ball is near or aligned under the coupler, if the trailer jack has raised the coupler.

**WARNING**
A loose hitch ball nut can result in uncoupling, leading to death or serious injury.
Make sure the hitch ball is tight to the hitch before coupling the trailer.
3.2.1.c Couple the Trailer to the Tow Vehicle
(Cequent Coupler)

- Using the jack, lower the trailer tongue until the coupler fully engages the hitch ball. If the coupler does not line up with the hitch ball, adjust the position of the tow vehicle.
- Engage the coupler locking mechanism. In the engaged position, the locking mechanism securely holds the coupler to the hitch ball.
- Insert a pin or lock through the hole in the locking mechanism.
- Be sure the coupler is all the way on the hitch ball and the locking mechanism is engaged. A properly engaged locking mechanism will allow the coupler to raise the rear of the tow vehicle.

Using the trailer jack, test to see that you can raise the rear of the tow vehicle by 1 inch, after the coupler is locked to the hitch.

**NOTICE**
The tongue jack can be damaged by overloading. Do not use the tongue jack to raise the tow vehicle more than 1 inch.

If the coupler cannot be secured to the hitch ball, do not tow the trailer. Call Featherlite, Inc. at 800-800-1230 or your dealer for assistance.

- Lower the trailer so that its entire tongue weight is held by the hitch, and continue retracting the jack to its fully retracted position.

3.2.1.d Couple the Trailer to the Tow Vehicle
(Demco Coupler)

- Using the jack, lower the trailer tongue until the coupler fully engages the hitch ball. If the coupler does not line up with the hitch ball, adjust the position of the tow vehicle.
- Lower the trailer to the ball (do not lift handle), while the coupler is going over the ball the handle will lift up automatically and lock over ball as it is lowered.

- There is no need to insert a pin into the hole (A). With the handle down it is securely locked. This hole is used for security only.
- Be sure the coupler is all the way on the hitch ball and the locking mechanism is latched. A properly engaged locking mechanism will allow the coupler to raise the rear of the tow vehicle.

Using the trailer jack, test to see that you can raise the rear of the tow vehicle by 1 inch, after the coupler is locked to the hitch.

**NOTICE**
The tongue jack can be damaged by overloading. Do not use the tongue jack to raise the tow vehicle more than 1 inch.

If the coupler cannot be secured to the hitch ball, do not tow the trailer. Call Featherlite, Inc. at 800-800-1230 or your dealer for assistance.

- Lower the trailer so that its entire tongue weight is held by the hitch, and continue retracting the jack to its fully retracted position.
3.2.1.e Rig the Safety Chains

- Visually inspect the safety chains and hooks for wear or damage. Replace worn or damaged safety chains and hooks before towing.
- Rig the safety chains so that they:
  - Criss-cross underneath the coupler so if the trailer uncouples, the safety chains can hold the tongue up above the road. See figure 3-7.
  - Loop around a frame member of the tow vehicle or to holes provided in the hitch system (but, do not attach them to an interchangeable part of the hitch assembly)
  - Attach hooks up from underneath the hole (do not just drop into hole); and
  - Provide enough slack to permit tight turns, but not be close to the road surface to drag.

**WARNING**
Incorrect rigging of the safety chains can result in loss of control of the trailer and tow vehicle, leading to death or serious injury, if the trailer uncouples from the tow vehicle.

Chains must:
- Fasten to frame of tow vehicle, not to hitch or ball.
- Cross underneath hitch and coupler with minimum slack to permit turning and to hold tongue up, if the trailer comes loose.

3.2.1.f Attach and Test the Breakaway Brake System

If the coupler or hitch fails, a properly connected and working breakaway brake system will apply electric brakes on the trailer. The safety chains will keep the tow vehicle attached and as the brakes are applied at the trailer’s axles, the trailer/tow vehicle combination will come to a controlled stop.

The breakaway brake system includes a controller, battery, and a switch with a pullpin, and lanyard. Read and follow the instructions here as well as the instructions that have been prepared by the breakaway brake manufacturer.

The breakaway brake system may be fitted with a “charging” capability that draws power from the tow vehicle. If the electrical system on your tow vehicle does not provide power to the breakaway brake battery, you must periodically charge the battery to keep the breakaway brake system in working order.
Visually inspect the breakaway system for broken or missing parts. Repair or replace worn, damaged or missing parts before towing trailer.

Connect the pullpin lanyard to the tow vehicle so that the pullpin will be pulled out before all of the slack in the safety chains is taken up (see Breakaway Brake Connection figure 3-8). Do not connect the pullpin lanyard to a safety chain or to the hitch ball or hitch ball assembly. This would keep the breakaway brake system from operating when it is needed.

To test the breakaway brake battery, remove the pullpin from the switch and attempt to pull the trailer forward. You should feel the trailer resisting being towed, but the wheels will not necessarily be locked. If the brakes do not function, do not tow the trailer until brakes, or battery, are repaired.

Immediately replace the pullpin. The breakaway brake system battery discharges rapidly when the pullpin is removed.

**WARNING**

An ineffective breakaway brake system can result in a runaway trailer, leading to death or serious injury if the coupler or ball hitch fails.

Test the function of the breakaway brake system before towing the trailer. Do not tow the trailer if the breakaway brake system is not working; have it serviced or repaired.

Connect the breakaway lanyard to the tow vehicle -

NOT to the safety chain; and

NOT to the hitch, ball or support.

Do not tow the trailer with the breakaway brake system ON because the brakes will overheat which can result in permanent brake failure.

**WARNING**

Failure to replace the pullpin can result in ineffective brakes, leading to loss of control, serious injury or death.

If you do not use your trailer for three or more months, or during winter months:

- Store the battery indoors; and
- Charge the battery every three months.

Replace the breakaway brake battery according to the intervals specified by the battery manufacturer.
3.2.1.g Connect the Electrical Cables

Connect the trailer lights to the tow vehicle's electrical system using the electrical connectors.

- Check all lights for proper operation.
  - Clearance and Running Lights (Turn on tow vehicle headlights).
  - Brake Lights (Step on tow vehicle brake pedal).
  - Turn Signals (Operate tow vehicle directional signal lever).
- Check electric brakes for proper operation using brake controller mounted in the cab.

If your trailer has electric brakes, your tow vehicle will have an electric brake controller that sends power to the trailer brakes. Before towing the trailer on the road, you must operate the brake controller while trying to pull the trailer in order to confirm that the electric brakes operate. While towing the trailer at less than 5 m.p.h., manually operate the electric brake controller in the tow vehicle cab. You should feel the operation of the trailer brakes.

**WARNING**

Failure to connect the tow vehicle lighting and braking to the trailer will result in inoperable lights and brakes, and can lead to collision.

Check that all the trailer lights and brakes work before each tow.

3.2.1.h Uncoupling the Ball Hitch Trailer

Follow these steps to uncouple your ball hitch trailer from the tow vehicle:

- Block trailer tires to prevent the trailer from rolling, before jacking the trailer up.
- Disconnect the electrical connector.
- Disconnect the breakaway brake switch lanyard.
- Disconnect the safety chains from the tow vehicle.
- Unlock the coupler and open it.

- Before extending jack, make certain the ground surface below the jack pad will support the tongue load.
- Rotate the jack handle (or crank) clockwise. This will slowly extend the jack and transfer the weight of the trailer tongue to the jack.

3.2.2 Trailer with Gooseneck Coupler and Drop-Leg Jack

A gooseneck coupler on the trailer connects to a gooseneck ball that you must have installed in the bed of the tow vehicle. This system of coupling a trailer to a tow vehicle permits the tow vehicle to turn to sharper angles than are permitted by a bumper hitch system. A gooseneck coupler consists of a tube in an inverted “U” shape and a gooseneck ball receiver. Figure 3-9 shows a trailer with a gooseneck coupler.

We have utilized a Gooseneck ball receiver that is suitable for the size and weight of the trailer. The load rating of the coupler and the necessary ball size are listed on the gooseneck.

You must provide a gooseneck ball and support structure that is marked with a rating that meets or exceeds the GVW Rating of your trailer and matches the size of the gooseneck ball receiver. If the gooseneck ball is too small, is underrated, is loose or is worn, the trailer can come loose from the tow vehicle, and may lead to death or serious injury.

THE TOW VEHICLE, SUPPORT STRUCTURE AND GOOSENECK BALL MUST HAVE A RATED TOWING CAPACITY EQUAL TO OR GREATER THAN THE TRAILER Gross Vehicle Weight Rating (GVWR).

IT IS ESSENTIAL THAT THE GOOSENECK BALL BE OF THE SAME SIZE AS THE GOOSENECK BALL RECEIVER.

IF THE GOOSENECK BALL IS TOO SMALL, IS UNDERRATED, IS LOOSE OR IS WORN, THE
Section 3 - Coupling To The Tow Vehicle

TRAILER CAN COME LOOSE FROM THE TOW VEHICLE, RESULTING IN DEATH OR SERIOUS INJURY.

The gooseneck ball size and load rating (capacity) are marked on the ball; hitch capacity is marked on the hitch.

WARNING

Coupler-to-hitch mismatch can result in uncoupling, leading to death or serious injury.
Make sure the hitch and ball are rated for the trailer coupling.
Make sure the hitch [ball size] matches the coupler.

3.2.2.a Adjust Gooseneck Hitch Height

It is your responsibility to have the height of the receiver adjusted to match the height of the gooseneck ball in your tow vehicle. Proper gooseneck ball receiver height adjustment is required to provide clearance between the bottom of the trailer and sides of the tow vehicle bed, to obtain level running of the trailer and to permit equal weight distribution on the axles. Your Featherlite dealer is able to perform the gooseneck ball receiver height adjustment to match the trailer to your towing vehicle.

Coupler With Two Set Screws

- Loosen the jam nuts and set screws (A) on the rear side of the coupler. See figure 3-10.
- Extend or retract the coupler as needed, but do not exceed the maximum extension in figure 3-11.
- Tighten setscrews to the torque listed in figure 3-11.
- Tighten jam nuts to 80-90 lb/ft of torque.
- Check tightness after 50 miles of towing.

<table>
<thead>
<tr>
<th>Coupler</th>

</tr>
</tbody>
</table>

Coupler Extension and Torque – Figure 3-11

Coupler With Load Bearing Pin

- Loosen the jam nuts and set screws (A) on the rear side of the coupler. See figure 3-12.
- Remove retaining pin (B) and load bearing pin (C).
- Extend or retract the coupler as needed up to a maximum of 8 inches from the fully retracted position.
- Fully insert load bearing pin (B) through one set of holes in coupler and outer tube. NEVER use the set screw or any other device as a replacement for the load bearing pin (B).
- Install retaining pin (C) on load bearing pin (B).
- Tighten setscrews (A) to 75-100 lb/ft of torque.
- Tighten jam nuts to 75-100 lb/ft of torque.
- Check tightness after 50 miles of towing.

A sleeve may be installed on the coupler to keep the coupler from retracting under heavy load conditions. See your Featherlite dealer.
3.2.2.b Drop-Leg Jack(s)

A trailer having a gooseneck hitch will have one or two drop leg jacks for raising and lowering the gooseneck ball receiver. Because several drop leg jack mechanisms are available, the general instructions below may vary slightly from the jack manufacturer’s instructions. If the trailer jack on your trailer does not resemble the jack shown in the figure 3-13, follow the jack instructions provided by the jack manufacturer.

3.2.2.c Before Coupling the Trailer to the Tow Vehicle

- Be sure the size and rating of the gooseneck ball match the size and rating of the receiver. Gooseneck balls and receivers are marked with their size and ratings.
- Wipe the gooseneck ball clean and inspect it visually and by feel for flat spots, cracks and pits.

- Rock the ball to make sure it is tight to the ball support, and visually check that the gooseneck ball nut is solid against the lock washer and ball support frame.

- Wipe the inside and outside of the receiver clean and inspect it visually for cracks; and feel...
the inside of the receiver for worn spots and pits. If any of these conditions exist, have the receiver replaced before coupling the trailer.

- Lubricate the inside of the gooseneck ball receiver with automotive bearing grease.
- Be sure the receiver is tight to the trailer. All receiver fasteners must be visibly solid against the trailer frame.
- Release the jack handle or crank from its holder (see “Drop Leg Jack” figure 3-13).
- Rotate the handle/crank clockwise to raise the bottom surface of the gooseneck to be above the top of the gooseneck ball.
- If the tow vehicle has a tailgate, lower it.

3.2.2.d Prepare the Ball Receiver and Gooseneck Ball

- Release the lock plate on the gooseneck ball receiver. With the spring-loaded lock plate locking pin in the OPEN position, rotate the lock plate to a position that allows the gooseneck ball to enter the receiver (see “Gooseneck Ball Receiver and Height Adjustment” figure 3-10).
- Slowly back up the tow vehicle so that the gooseneck ball is aligned under the gooseneck ball receiver.

⚠️ WARNING

No one must be under the trailer or coupler during the coupling.

Death or serious injury can occur if the trailer drops.

3.2.2.e Couple the Trailer to the Tow Vehicle

- Rotate the jack handle counter-clockwise. This will retract the jack causing the gooseneck ball receiver to drop down so it can fully engage the gooseneck ball and transfer the weight of the trailer tongue to the towing vehicle hitch. If the receiver does not line up with the ball, raise the receiver again and adjust the position of the tow vehicle. Then lower the receiver over the ball. When the drop leg base is no longer resting on the ground, the towing vehicle hitch is holding all of the weight of the trailer tongue.
- Close the lock plate on the gooseneck ball receiver.

- Move the spring-loaded lock plate locking pin to the CLOSED position. Be sure the locking pin is holding the lock plate.
- Be sure the receiver is all the way on the gooseneck ball and the lock plate is engaged. A properly engaged locking mechanism will allow the coupler to raise the rear of the tow vehicle. Using the trailer jack, test to see that you can raise the rear of the tow vehicle by 1 inch.

NOTICE

The drop leg jack can be damaged by overloading. Do not use the drop leg jack to raise the tow vehicle more than 1 inch.

If the gooseneck ball cannot be secured to the receiver, do not tow the trailer. Call Featherlite, Inc. at 800-800-1230 or your dealer for assistance.

- After testing to see that the receiver is properly secured and locked to the ball, retract the jack to its fully retracted position.
- Return the drop legs to their upper positions. The drop legs are held in the lowered position with a plunger pin. Rotating the plunger pin while pulling it outward will cause it to come out of engagement with the drop leg and the leg will rapidly rise. See figure 3-14.
- If the tow vehicle is equipped with a tailgate, raise it.
- Pick up the trailer wheel blocks.

⚠️ CAUTION

The drop legs are heavily spring loaded in the lowered position. They will rapidly return to the upper position when released and can inflict serious bruises, scrapes or pinching.

Keep your feet, shins and hands well clear of the drop legs and drop leg bases when releasing the drop legs.
3.2.2.f Rig the Safety Chains

- Visually inspect the safety chains and hooks for wear or damage. Replace worn or damaged safety chains and hooks before towing.
- Rig the safety chains so that they attach to the “safety chain receivers” on the tow vehicle. If you are not certain of the hitch provisions for receiving safety chains, contact the hitch manufacturer or installer. Do NOT attach the safety chains to the gooseneck ball or its support; and
- Rig the safety chains so they have sufficient slack to permit turning, but not too much slack – the safety chains must keep the gooseneck on the tow vehicle bed if the trailer uncouples. See figure 3-15.

3.2.2.g Attach and Test the Breakaway Brake System

If the coupler or hitch fails, a properly connected and working breakaway brake system will apply electric brakes on the trailer. The safety chains will keep the tow vehicle attached and as the brakes are applied at the trailer’s axles, the trailer/tow vehicle combination will come to a controlled stop. See figure 3-16.

The breakaway brake system includes a breakaway brake controller, battery, and a switch with a pullpin, and lanyard. Read and follow the instructions here as well as the instructions that have been prepared by the breakaway brake controller manufacturer.

The breakaway brake system may be fitted with a charging facility that draws power from the tow vehicle. If the electrical system on your tow vehicle does not provide power to the breakaway brake battery you must periodically charge the battery on the trailer to keep the breakaway brake system in working order.
Section 3 - Coupling To The Tow Vehicle

- Visually inspect the breakaway brake system for broken parts.
- Connect the pullpin lanyard to the tow vehicle so that the pullpin will be pulled out before all of the slack in the safety chains is taken up (see “Breakaway Brake Connection” figure 3-16). Do not connect the pullpin lanyard to a safety chain, safety chain receiver, or to the gooseneck ball or its support. This would keep the breakaway brake system from operating when it is needed. Contact the hitch manufacturer or installer if you are not certain of the hitch provisions for the breakaway brake connection.
- To test the breakaway brake battery, pull out the pullpin from the switch and attempt to pull the trailer forward. You should feel the trailer resisting being towed, but the wheels will not necessarily be locked. If the brakes do not function, do not tow the trailer until brakes, or battery, are repaired.
- Immediately replace the pullpin. The breakaway brake system battery discharges rapidly when the pullpin is removed.

**WARNING**

An ineffective or inoperative breakaway brake system can result in a runaway trailer leading to death or serious injury if the coupler or hitch fails.

Connect the breakaway lanyard to the tow vehicle; and NOT to the safety chain, safety chain receiver, gooseneck ball or gooseneck ball support.

Test the function of the breakaway brake system before towing the trailer. Do not tow the trailer if the breakaway brake system is not working. Have it serviced or repaired.

Do not tow the trailer with the breakaway brake system ON because the brakes will overheat which can result in permanent brake failure.

**WARNING**

Failure to replace the pullpin can result in ineffective brakes, leading to loss of control, serious injury or death.

If you do not use your trailer for three or more months, or during winter months:

- Store the battery indoors; and
- Charge the battery every three months.

Replace the breakaway brake battery according to the intervals specified by the battery manufacturer.

3.2.2.h Connect the Electrical Cables

Connect the trailer lights to the tow vehicle's electrical system using the electrical connectors.

- Check all lights for proper operation:
  - Clearance and Running Lights (Turn on tow vehicle headlights).
  - Brake Lights (Step on tow vehicle brake pedal).
  - Turn Signals (Operate tow vehicle directional signal lever).

- Check electric brakes for proper operation using the controller mounted in the cab.

If your trailer has electric brakes, your tow vehicle will have an electric brake controller that sends power to the trailer brakes. Before towing the trailer on the road, you must operate the brake controller while trying to pull the trailer in order to confirm that the electric brakes operate. While towing the trailer at less than 5 m.p.h., manually operate the electric brake controller in the tow vehicle cab. You should feel the operation of the trailer brakes.

**WARNING**

Failure to connect the tow vehicle lighting and braking to the trailer will result in inoperable lights and brakes, and can lead to collision.

Check that all the trailer lights and brakes work before each tow.

3.2.2.i Uncoupling the Gooseneck Trailer with Drop-Leg Jack

Follow these steps to uncouple your gooseneck hitch trailer from the tow vehicle:
• Block trailer tires to prevent the trailer from rolling, before jacking the trailer up
• Disconnect the electrical connector.
• Disconnect the breakaway brake switch lanyard.
• Disconnect the safety chains from the tow vehicle.
• If the tow vehicle has a tailgate, lower it.
• Move the spring-loaded gooseneck receiver lock plate locking pin to the OPEN position (see “Gooseneck Ball Receiver and Height Adjustment” figure).
• Rotate the lock plate to a position that permits the gooseneck ball to exit the receiver.
• Before releasing dropleg jack, make certain ground surface below jack base will support the trailer tongue load.
• Rotate the drop leg plunger pin handle so that the plunger pin is released from the drop leg (see “Releasing Drop Leg Mechanism” figure).
• Push down on the drop leg base with your foot to place a drop leg to the desired lowered position.
• Rotate the plunger pin handle so that the plunger pin is attempting to engage the drop leg (see “Drop Leg Jack Mechanism” figure)
• Slowly raise your foot, permitting the drop leg to rise. The plunger pin will engage a hole in the drop leg.

⚠️ CAUTION

The drop legs are heavily spring loaded in the lowered position. They will rapidly return to the upper position when released and can inflict serious bruises, scrapes or pinching.

Keep your feet, shins and hands well clear of the drop legs and drop leg bases when releasing the drop legs.

• Release the handle (or crank) from its holder and engage it with the jack shaft (see “Drop Leg Jack Mechanism” figure 3-14).
• Rotate the handle (or crank) from its hold and engage it with the jack shaft.
• Rotate the handle (or crank) clockwise to slowly extend the jack and transfer the weight of the trailer tongue to the jack.
• On two speed jacks, pushing the handle shaft toward the gearbox can perform rapid extension. This shifts the gearbox into a high speed mode.
• When the drop leg base contacts the ground, shift the gearbox into low speed mode by pulling out on the handle shaft until it locks into low gear.

⚠️ NOTICE

If the drop legs are not set at the same level, one of the drop leg jacks can be overloaded and can be damaged.

Do not use high speed to lift the trailer, the drop leg jack mechanism can be damaged.

High speed is used only to rapidly move the drop leg base into contact with the ground.

Continue to extend the jack(s), making sure that the ground is providing stable and level support for the trailer.

After the jack(s) are extended and the gooseneck ball receiver is well clear of the gooseneck ball, to permit driving the tow vehicle away, disengage the handle from its shaft and return to its holder.

3.2.3 Trailer with Fifth Wheel Coupler or King Pin and Drop-Leg Jack

A fifth wheel coupler on the trailer connects to a kingpin that is installed on the trailer. A fifth wheel coupler on the tow vehicle connects to a king pin installed on the trailer. See figures 3-17 and 3-18.

A fifth wheel coupler includes a flat load-bearing plate with a slot, and a mechanism inside the slot that “grips” the kingpin.
Featherlite has selected a fifth wheel coupler that is suitable for the size and weight of the trailer. You must provide a kingpin and kingpin plate that match the fifth wheel, and that is rated for the Gross Vehicle Weight Rating (GVWR) of your trailer.

3.2.3.a Before Coupling the Trailer to the Tow Vehicle

- Be sure the size and rating of the fifth wheel and kingpin match.
- Wipe the kingpin clean and inspect it visually and by feel for flat spots, cracks and pits. Check the condition of the kingpin mounting in the bed of the tow vehicle.

A worn, bent, cracked or corroded kingpin can fail while towing, and may result in death or serious injury.

Check the kingpin and kingpin plate for wear, bending, cracks or corrosion before coupling.

Replace worn, bent, cracked or corroded kingpin before coupling the trailer.

- Be sure the fifth wheel mechanism operates freely.
- Lubricate the fifth wheel plate surface with a light coat of Lithium-base, waterproof grease.
- Be sure the fifth wheel and kingpin fasteners are tight and any welds are solid.

3.2.3.b Adjust Hitch Height

It is your responsibility to have the height of the king pin or fifth wheel adjusted to match the height of the fifth wheel or king pin in your tow vehicle. Proper height adjustment is required to provide clearance between the bottom of the trailer and sides of the tow vehicle bed, to obtain level running of the trailer and to permit equal weight distribution on the axles. Your Featherlite dealer is able to perform the coupler height adjustment to match the trailer to your towing vehicle.

- Loosen the jam nuts and set screws (A) on the rear side. See figure 3-19.
- Extend or retract the king pin or fifth wheel as needed, but do not exceed 8 inches maximum extension.
- Tighten setscrews (A) to 75-100 lb ft of torque.
- Tighten jam nuts to 75-100 lb/ft of torque.
- Check tightness after 50 miles of towing.
3.2.3.c Prepare the Fifth Wheel Coupler

- Be sure the locks are open (see “Fifth Wheel Checks” figure 3-18).
- If the tow vehicle is equipped with a tailgate, lower it.
- Block the trailer wheels, front and rear.
- Make certain that trailer fifth wheel plate is slightly above the kingpin plate on the tow vehicle.

3.2.3.d Couple the Trailer to the Tow Vehicle

- Back tow vehicle up close to the trailer, centering the kingpin in the slot of the fifth wheel.
- STOP before engaging the coupling.

**WARNING**

No one must be under the trailer or coupler during the coupling.

Death or serious injury can occur if the trailer drops.

- Adjust the height of the trailer, using the jack, so that the fifth wheel plate just touches the kingpin plate.
- Slowly back up the tow vehicle, keeping the kingpin centered in the slot of the fifth wheel. Continue backing up until the fifth wheel locks firmly on the kingpin.
- Visually check to confirm that the fifth wheel locks are properly locked onto the kingpin by performing the three checks illustrated in the “Fifth Wheel Checks” figure 3-20.
- Attempt to pull forward as an initial test of the closing of the fifth wheel locks.

**Fifth Wheel Checks – Figure 3-20**

- Check 1 – The adjustment nut must be seated against the fifth wheel.
- Check 2 – The secondary lock must be behind the yoke.
- Check 3 – The fifth wheel must be in contact with the kingpin plate, with no space.

**WARNING**

An improperly coupled fifth wheel can come loose, resulting in death or serious injury.

Do not tow the trailer until all of the visual checks are met.

- Adjustment nut against fifth wheel.
- Secondary lock behind yoke.
- Fifth wheel against kingpin plate.

Raise The Drop-Leg Jack

A trailer having a fifth wheel coupler will be outfitted with one or two drop leg jacks for raising and lowering the fifth wheel coupler. Because we use several drop leg jack mechanisms, the general instructions below may vary slightly from the jack manufacturer’s instructions. If the trailer jack on your trailer does not resemble the jack shown in the figures, follow the jack instructions provided by the jack manufacturer.

- Rotate the jack handle counter-clockwise. This will slowly retract the jack and transfer the weight of the trailer tongue to the towing vehicle. When the drop leg base is no longer resting on the ground, the towing vehicle hitch is holding all of the weight of the trailer tongue.
Continue retracting the jack to its fully retracted position.

- Return the drop legs to their upper positions. The drop legs are held in the lowered position with a plunger pin. Rotating the plunger pin while pulling it outward about ¾ inch will cause it to come out of the engagement with the drop leg and the leg will rapidly raise. See figure 3-21.
- Raise the tailgate.
- Pick up the trailer wheel blocks.

\[\begin{align*}
\text{Drop Leg Jack Mechanism - Figure 3-21}
\end{align*}\]

\[\begin{align*}
\text{CAUTION}
\end{align*}\]

The drop legs are heavily spring loaded in the lowered position. They will rapidly return to the upper position when released and can inflict serious bruises, scrapes or pinching.

Keep your feet, shins and hands well clear of the drop legs and drop leg bases when releasing the drop legs.

3.2.3.e Attach and Test the Breakaway Brake System

If the coupler fails, a properly connected and working breakaway brake system will apply electric brakes on the trailer. See figure 3-20

The breakaway brake system includes a breakaway brake controller, battery and a switch with a pullpin and lanyard. Read and follow the instructions here as well as the instructions that have been prepared by the breakaway brake controller manufacturer.

The breakaway brake system may be fitted with a charging facility that draws power from the tow vehicle. If the electrical system on your tow vehicle does not provide power to the breakaway brake battery, you must periodically charge the battery to keep the breakaway brake system in working order.

- Visually inspect the breakaway brake system for broken parts.
- Connect the pullpin lanyard to the tow vehicle (see “Breakaway Brake Connection” figure 3-20). Do **not** connect to kingpin or its support.
- To test the breakaway battery remove the pullpin from the switch and attempt to pull the trailer forward. You should feel the trailer resisting being towed, but the wheels will not necessarily be locked. If the brakes do not function, do not tow the trailer until brakes, or battery, are repaired.
- Immediately replace the pullpin. The breakaway brake system battery discharges rapidly when the pullpin is removed.
An ineffective breakaway brake system can result in a runaway trailer, if the fifth wheel hitch fails, leading to death or serious injury.

Test the function of the breakaway brake system before towing the trailer. Do not tow the trailer if the breakaway brake system is not working; have it serviced or repaired.

Connect the breakaway lanyard to the tow vehicle—NOT to the kingpin or its support.

Do not tow the trailer with the breakaway brake system ON because the brake will overheat which can result in permanent brake failure.

Failure to replace the pullpin can result in ineffective brakes, leading to loss of control, serious injury or death.

If you do not use your trailer for three or more months, or during winter months:

- Store the battery indoors; and
- Charge the battery every three months.

Replace the breakaway brake battery at intervals recommended by the battery manufacturer

3.2.3.f Connect the Electrical Cables

- Connect the trailer lights to the tow vehicle's electrical system using the electrical connectors. Check all lights for proper operation:
  - Clearance and Running Lights (Turn on tow vehicle headlights).
  - Brake Lights (Step on Tow vehicle brake pedal).
  - Turn Signals (Operate tow vehicle directional signal lever).

Check brakes for proper operation: While towing the trailer at less than 5 m.p.h., manually operate the electric brake controller in the tow vehicle cab. You should feel the operation of the trailer brakes.

Failure to connect the tow vehicle lighting and braking to the trailer will result in inoperable lights and brakes, and can lead to collision.

Check that all the trailer lights and brakes work before each tow.

3.2.3.g Uncoupling the Fifth Wheel Trailer

Follow these steps to uncouple your fifth wheel hitch trailer from your tow vehicle.

- Block trailer tires to prevent the trailer from rolling before jacking the trailer up.
- Disconnect the electrical connector.
- Disconnect the breakaway brake switch lanyard.
- If the tow vehicle has a tailgate, lower it.
- Make certain that ground surface below jack base will support trailer tongue load.
- Rotate the drop leg plunger pin handle so that the plunger pin is released from the drop leg. See figure 3-21.
- Push down on the drop leg base with your foot to place a drop leg to the desired lowered position.

The drop legs are heavily spring loaded in the lowered position. They will rapidly return to the upper position when released and can inflict serious bruises, scrapes or pinching.

Keep your feet, shins and hands well clear of the drop legs and drop leg bases when releasing the drop legs.

- Rotate the plunger pin handle so that the plunger pin is attempting to engage the drop leg. See figure 3-21.
- Slowly raise your foot, permitting the drop leg to rise. The plunger pin will engage a hole in the drop leg.
- Be sure the plunger pin is fully engaged. Push it in by hand if necessary. The bent part of the plunger pin handle must be touching the plunger pin housing.
If your trailer has two drop leg jacks, lower them both to the same level, following the preceding instructions.

**NOTICE**

If the drop legs are not set at the same level, one of the drop leg jacks can be overloaded and can be damaged.

- Release the handle (or crank) from its holder and engage it with the jack shaft.
- Rotate the handle (or crank) clockwise to slowly extend the jack and transfer the weight of the trailer tongue to the jack.
- On two speed jacks, pushing the handle shaft toward the gearbox can perform rapid extension. This shifts the gearbox into a high speed mode.
- When the drop leg base contacts the ground, shift the gearbox into low speed mode by pulling out on the handle shaft until it locks into low gear.

**NOTICE**

Do not use high speed to lift the trailer, the drop leg jack mechanism can be damaged.

High speed is used only to rapidly move the drop leg base into contact with the ground.

- Continue to extend the jack(s), making sure that the ground is providing stable and level support for the trailer.
- Turn the crank two or three turns to take some of the weight of the coupling. Do not raise the fifth wheel off the kingpin plate.
- After the jack(s) are extended enough to permit driving the tow vehicle away, disengage the jack handle from its shaft and return it to its holder. Do NOT drive the tow vehicle yet!

- Open the fifth wheel locks by:
  - pulling the release handle, or
  - using a separate pipe release handle to engage the solid stud on the secondary lock. See figure 3-23.

- Slowly drive the tow vehicle away from the trailer.
- Raise the tow vehicle tailgate.
Improper trailer loading causes many accidents and deaths. To safely load a trailer, you must consider:

- Overall load weight;
- Load weight distribution;
- Proper tongue weight; and
- Securing the load properly.

To determine that you have loaded the trailer within its rating, you must consider the distribution of weight, as well as the total weight of the trailer and its contents. The trailer axles carry most of the total weight of the trailer and its contents (Gross Vehicle Weight, or “GVW”).

The remainder of the total weight is carried by the tow vehicle hitch. It is essential for safe towing that the trailer tongue and tow vehicle hitch carry the proper amount of the loaded trailer weight, otherwise the trailer can develop an undesirable sway at towing speeds, or the rear of the towing vehicle can be overloaded. Read the “Tongue Weight” section that follows.

The load distribution must be such that no component part of the trailer is loaded beyond its rating. This means that you must consider the rating of the tires, wheels and axles. For tandem and triple axle trailers, you must make sure that the front-to-rear load distribution does not result in overloading any axle.

Towing stability also depends on keeping the center of gravity as low as possible. Load heavy items on the floor and over the axles. When loading additional items, be sure to maintain even side-to-side weight distribution and proper tongue weight. The total weight of the trailer and its contents must never exceed the total weight rating of the trailer (Gross Vehicle Weight Rating, or “GVWR”).

### WARNING

An overloaded trailer can result in failure or in loss of control of the trailer, leading to death or serious injury.

Never load a trailer so that the weight on any tire exceeds its rating.

Never exceed the trailer Gross Vehicle Weight Rating (GVWR).

Never exceed an axle Gross Axle Weight Rating (GAWR).

#### Tongue Weight

It is critical to have a portion of the trailer load carried by the tow vehicle. That is, the trailer tongue must exert a downward force on the hitch. This is necessary for two reasons. First, the proper amount of tongue weight is necessary for the tow vehicle to be able to maintain control of the tow vehicle/trailer system. If, for example, the tongue exerts an upward pull on the hitch, instead of pushing down on it (because the trailer is overloaded behind its axle(s)), the rear wheel of the tow vehicle can lose traction or grip and cause loss of control. Also, even if there is some weight on the tongue, but not enough weight on the tongue, the trailer can become unstable at high speeds. Remember, the faster you go, the more likely the trailer is to sway.

If, on the other hand, there is too much tongue weight, the tow vehicle is prone to jack-knife. Furthermore, the front wheels of the tow vehicle can be too lightly loaded and cause loss of steering control and traction, if the front wheels are driving.

In addition to tow vehicle control, tongue weight is necessary to insure that the trailer axle(s) do not exceed their Gross Axle Weight Rating (GAWR).

In the following table, the second column notes the rule of thumb percentage of total weight of the trailer plus its cargo (Gross Vehicle Weight, or “GVW”) that should appear on the tongue of the trailer. For example, a trailer with a gooseneck hitch, with a loaded weight of 12,000 pounds, should have 20-25% of 12,000 pounds on the
tongue. That is, the example trailer would have 2,400 to 3,000 pounds on its tongue.

### Tongue Weight as a Percentage of Loaded Trailer Weight

<table>
<thead>
<tr>
<th>Type of Hitch</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ball Hitch (or Bumper Hitch)</td>
<td>10–15% for large trailers</td>
</tr>
<tr>
<td></td>
<td>6–10% for smaller utility</td>
</tr>
<tr>
<td></td>
<td>and cargo trailers</td>
</tr>
<tr>
<td>Gooseneck Hitch</td>
<td>20–25%</td>
</tr>
<tr>
<td>Fifth Wheel Hitch</td>
<td></td>
</tr>
</tbody>
</table>

### WARNING

An improperly distributed load can result in loss of control of the trailer, and can lead to death or serious injury.

Proper tongue weight is essential for stable trailer handling.

Distribute the load front to rear to provide proper tongue weight.

Distribute the load evenly, right and left, to avoid tire overload.

Keeping the center of gravity low and centered is essential to minimize the risk of tip-over.

### 4.1 CHECKING TONGUE WEIGHT

To check the tongue weight, the tow vehicle and trailer must be on level ground, as they will be when the trailer is being towed.

For lighter trailers the recommended method of checking tongue weight is to use an accessory called a “tongue weight scale.” The following tongue weight scales are available from your Featherlite dealer. (The 2000 lb. capacity model is most commonly useful.)

<table>
<thead>
<tr>
<th>Capacity</th>
<th>Part Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>1,000 lbs.</td>
<td>014009.0001</td>
</tr>
<tr>
<td>2,000 lbs.</td>
<td>014009.0002</td>
</tr>
<tr>
<td>5,000 lbs.</td>
<td>014009.0005</td>
</tr>
</tbody>
</table>

If a tongue weight scale is not available from your dealer, call Featherlite, Inc. at 800-800-1230 for assistance.

### WARNING

An unrestrained trailer can fall off its support, resulting in serious injury or death.

Block trailer wheels, front and rear, before checking tongue weight.

For most trailers it is easier to go to a truck stop where there is a “certified” scale. Pull the trailer onto the scale and decouple it from the tow vehicle, leaving just the trailer on the scale. Get a “ticket”, which lists the total trailer weight. Re-connect the trailer to your tow vehicle and the drive the tow vehicle wheels off the scale, just leaving the trailer axles on the scale. Get a second “ticket”, which lists the trailer’s axle weight. Simple subtract the axle weight from the total weight to determine the hitch weight.

It is also desirable, while you are at the scale, to weigh the entire combination vehicle. This result should be less than the Gross Combined Weight Rating (GCWR) for your towing vehicle. Some scales allow you to get individual axle weights also. If this is possible, get the tow vehicles front and rear axle weights to make sure they are in the same proportion as the tow vehicle alone, and that the rear axle is not overloaded.

You are responsible to secure your cargo in such a way that it does not shift within the trailer, while the trailer is being towed. The “ride” inside a trailer can be very bumpy and rough.
Section 4 – Loading The Trailer

4.2 LOADING A FLATBED TRAILER

Couple the trailer to the tow vehicle before loading. The tongue of a bumper pull trailer can rise during loading, before the cargo is properly distributed.

Depending on the exact model of your Featherlite trailer, the cargo carrying portion may be designed for carrying such things as:

- A car
- Snowmobiles
- All-Terrain Vehicles (ATVs)
- Motorcycles
- Farm Equipment, Tractors, etc.

Do not transport people, containers of hazardous substances, cans or containers of flammable substances. However, fuel in the tank of an off-road vehicle, or a car or motorcycle, etc., may be carried on of your trailer.

4.2.1 Preparing the Trailer for Loading

Before loading your open trailer, inspect the floor of the trailer.

Open trailers may be fitted with “D”-ring hold-downs, and/or a track system that can be used to secure the cargo. Inspect the “D”-rings and track system for looseness or signs of bending before loading the cargo onto the trailer.

**WARNING**

Never transport people on your Featherlite trailer. Besides putting their lives at risk, the transport of people may be illegal.

**WARNING**

Other than the fuel in the tanks of vehicles loaded on the trailer, your Featherlite trailer is not capable of safely transporting flammable, explosive, poisonous or other dangerous materials.

4.2.1.a Loading a Rigid-deck Trailer

Open trailers have either a rigid-deck or a pivoting deck, depending on the exact model. This subsection describes loading a rigid-deck trailer.

Before loading a rigid-deck trailer, couple the trailer to the tow vehicle and make sure the rigid-deck is level. Do not load or unload the trailer when the deck is not level.

1. Make sure the top of the ramp (or ramps) is secure to the trailer, and the bottom is resting on firm ground. Pockets may be provided to hold the ramp to the frame of the trailer.

2. Load the cargo onto the trailer with approximately 60% of the cargo in the front half of the trailer.

3. Secure the cargo to the trailer using appropriate straps, chains and tensioning devices. Since the trailer “ride” can be bumpy and rough, you must secure your cargo so that it does not shift while the trailer is being towed.

**WARNING**

Damaged or loose “D”-rings can break, allowing cargo to become loose inside the trailer. Loose cargo can shift the center of gravity, and result in loss of control of the trailer.

Inspect “D”-rings, and test them for looseness before loading cargo.

Do not use a damaged or loose “D”-ring to secure cargo.

**WARNING**

Load can suddenly move or topple, which can result in death or serious injury.

Do not load or unload your open trailer unless it is prevented from tipping and is on firm and level ground.
Section 4 – Loading The Trailer

**WARNING**

Shifting cargo can result in loss of control of the trailer, and can lead to death or serious injury.

Tie down all loads with proper sized fasteners, ropes, straps, etc.

4. Return the ramp(s) to their stowed position(s), and secure them so that they will not move during transit.

4.2.1.b Loading a Manually Pivoting-deck (Tilt-Deck) Trailer

Some open trailers are equipped with a pivoting-deck instead of with ramps. The pivoting feature allows for easier loading and unloading. See figure 4-1.

![Pivoting Deck Trailer – Figure 4-1](image)

The pivoting-deck trailer is fitted with a spring-loaded catch that keeps the trailer in the driving position. After the trailer is loaded and the cargo is secured with hold downs, be sure the spring-loaded catch has locked the trailer into “driving position.”

1. Couple the trailer securely to the tow vehicle before attempting to unlock the deck and load the trailer.

2. Unlock the deck and pivot it to the Loading position (see “Pivoting-Deck Trailer” figure). Before loading the cargo, be certain the deck catch pin is retracted.

3. Load the cargo onto the trailer with approximately 60% of the cargo in the front half of the deck. As the cargo is moved forward on the deck, the deck will pivot down into the driving position.

4. Extend the deck catch pin into the deck to lock the deck into the driving position (see “Pivoting-Deck Trailer” figure 4-1). Ensure that the catch engages the hole in the pivoting deck.

5. Secure the cargo onto the trailer using appropriate straps and tensioning devices. Since the trailer “ride” can be bumpy and rough, you must secure your cargo so that it does not shift while the trailer is being towed.

4.2.1.c Loading a Hydraulic Pivoting-deck (Tilt-Deck) Trailer

Some open trailers are equipped with a hydraulically operated pivoting-deck. The pivoting feature allows for easier loading and unloading. See figure 4-2.
Section 4 – Loading The Trailer

1. Couple the trailer securely to the tow vehicle before attempting to pivot the deck and load or unload the trailer.
2. Open the box on the front of the trailer and move both valves (A) to the open position.
3. Move pump switch (B) to the on position and wait at least one minute before attempting to tilt trailer deck.
4. The trailer is equipped with a wireless remote and a pendent to control the tilt deck. If using the wireless, press 1 for up and 2 for down. The other buttons have no function.
5. Tilt trailer deck until rear of trailer touches the ground. The tires on the front axle may come off the ground, this is normal. Do not raise all four tires off of the ground.

If using the pendent, connect the pendent cable to the connector on the side of the box. Press button (C) for up or button (D) for down.
Section 4 – Loading The Trailer

6. Load the cargo onto the trailer with approximately 60% of the cargo in the front half of the deck.

7. Press button 2 on the remote or the down button to fully lower the trailer deck to the travel position.

8. Move pump switch (B) to the off position.

9. Move both valves (A) to the off position. Both valves must be in the off position before towing.

10. If using the pendent, disconnect cable. Stow pendent or wireless remote and close box lid.

11. Secure the cargo onto the trailer using appropriate straps and tensioning devices.

Since the trailer “ride” can be bumpy and rough, you must secure your cargo so that it does not shift while the trailer is being towed.

---

**WARNING**

Shifting cargo can result in loss of control of the trailer, and can lead to death or serious injury.

Tie down all loads with proper sized fasteners, ropes, straps, etc.

---

4.2.2 Deck Prop

The deck prop supplied as part of the trailer is to be used only when the trailer deck is empty. The purpose of the deck prop is a back-up to the hydraulic system and will hold the empty trailer deck in a raised position while performing maintenance on the hoist, trailer body, or the trailer itself.

Remove lock pin (A) and pin. Pivot deck prop down over socket (B). Lower deck until prop is supporting deck.
DO NOT use the deck prop to support a loaded trailer.

DO NOT perform maintenance under a raised trailer deck without first blocking the empty trailer deck up with the deck prop.

**DANGER**

Crushing hazard.

NEVER enter the area under the trailer unless the trailer is empty and supported by the deck prop.

**WARNING**

Risk of death by crushing.
Trailer deck can drop unexpectedly.
NEVER go under a raised trailer deck.
Use deck prop for maintenance.

4.2.3 Hydraulic Components

Do not alter or substitute any hydraulic components on the tilt deck trailer. The hydraulic system is designed with each component being compatible with the safe and reliable operation of the hydraulic system. Under no circumstances should you alter the hydraulic pressure to the hydraulic system. Do not adjust flow control valves (A).

**DANGER**

NEVER alter or substitute any hydraulic system component. Death or serious injury may result.

An altered or component substituted hydraulic system may malfunction, resulting in the trailer deck falling without warning.

NEVER alter or substitute any hydraulic system component.

Always have the hydraulic system repaired or maintained by a qualified technician.

4.3 LOADING A DUMP TRAILER

4.3.1 Prepare Trailer for Loading

Payload Capacity: Check if the trailer has “payload” decals on the sides. If not, then determine the payload, or Cargo Capacity, by subtracting the empty weight of the trailer from the GVWR given on the Certification / VIN tag. Determine the density of the material to be loaded and dumped so that you will know, approximately, how much material may be safely loaded, carried, and dumped.

**WARNING**

Trailer, hitch or dump body can fail.
You or others can die or be seriously injured.
Load in trailer must not exceed the payload capacity – It must be evenly distributed.

Couple the trailer to the towing vehicle before loading. This is essential for bumper pull trailers because the tongue can rise during loading. To measure the tongue weight you will have to de-couple the trailer after it is loaded.

Be sure the trailer is located on firm, level ground. Attempting to load on uneven ground may cause the trailer to overturn, which can result in serious injury or death.

Inspect the trailer for corrosion or damage.
Verify that the dump body is fully lowered.

Close and properly latch the tailgates.

If the trailer is damaged, do not load the trailer. Take the trailer to your Featherlite dealer for repairs before using it to carry cargo.

**WARNING**

RAISED DUMP BODY CAN DROP OR TIP OVER SUDDENLY. YOU AND OTHERS CAN DIE OR BE SERIOUSLY INJURED.

YOU MUST:

- Have trailer on level, firm ground before dumping.
- Keep others away while dumping.
- Stay at controls until dump body is down.

NEVER LEAVE THE SCENE WHEN DUMP BODY IS LIFTED.

- Lock hoist controls after use.
- Have dump body down before moving trailer.
- Use body-prop and have dump body empty before getting under raised dump body.
- If the hoist does not lift the load: - Manually reduce the load - obtain service from a qualified hydraulics technician.

NEVER ASSIST THE HOIST. (i.e., with a jack, crane, heavy equipment, etc.

- If the load does not leave the dump body:
- Lower the dump body and manually free the load.
- Never attempt to free a load from a raised dump body.

Do not transport people, containers of hazardous substances, or cans of flammable liquids. However, fuel in the tank of a tractor, skid-steer loader, generator, etc. may be carried in the dump trailer.

**WARNING**

Other than the fuel in the tanks of vehicles loaded on the trailer, your Featherlite trailer is not capable of safely transporting flammable, explosive, poisonous or other dangerous materials.

4.3.1.a Loading Bulk (Flowable Loads) Material

1. Flowable loads will assume an even weight distribution within the trailer.
2. Couple the trailer to the tow vehicle.
3. Check the dump body for damage.
4. Close and fasten doors.
5. Level (evenly distribute) the load within the trailer from front to back and from side to side.
6. All flowable loads that may blow out while driving must be covered with a tarp. Secure tarp to trailer.

**WARNING**

An overloaded or improperly distributed load can result in death or serious injury.

An overloaded trailer can cause the hydraulic system to malfunction, resulting in the dump body falling.

A load that is improperly distributed in the trailer can result in the trailer tipping over when the dump body is raised.

**WARNING**

Failure to close and latch the rear doors creates a driving hazard which can result in death or serious injury.

The rear doors MUST be closed and latched before towing trailer.

4.3.1.b Loading Fixed Loads

1. Fixed loads that are to be carried or dumped should be loaded evenly throughout the trailer. Too much load in the front portion will strain and possibly overload the hydraulic hoist. Too much load in the rear will lead to reduced trailer sway stability at highway speeds.
2. Inspect the “hold-down” openings or “D” rings for any cracks or kinks.
3. Clear the area around the dump trailer
Section 4 – Loading The Trailer

4. Load the equipment or material. If loading ramps are used, the operator must be experienced and skilled to perform the loading.
5. Secure the equipment with proper sized straps, chains and tensioning devices.
6. Close and latch doors.

4.3.1.c Securing The Cargo
Since the trailer cargo is subjected to longitudinal (front / back) and lateral (side / side) forces you must secure all cargo that is not flowable, so that it does not shift while the trailer is being towed.

![WARNING]

Shifting cargo can result in loss of control of the trailer, and can lead to death or serious injury.

Tie down all non flowable loads with proper sized fasteners, ropes, straps, etc.
Cover all flowable loads that may blow out with a tarp.

4.3.1.d Unload Bulk Material (Flowable Loads) Into A Pile
1. Read and understand the hoist operating procedure before dumping the load.
2. Be sure the trailer is on level ground, both left / right and front / back. Attempting to unload on uneven ground may cause the trailer to overturn, which can result in serious injury or death.
3. Clear the area around the dump trailer.

![CAUTION]

Loaded materials can exert pressure against the rear gates. This may cause the gates to swing out with force when unlatched, causing serious injury.

Do not stand directly behind gates when unlatching.

4. Open the rear doors, and make sure they are securely hooked to the sides of the trailer using the hold back door chains.

5. Unlock and open the hydraulic control box on the trailer tongue and locate the dump body control. Position yourself in a safe location clear of the dump body. Check for overhead power lines and other obstructions before raising dump body. The control box cover should be locked when the dump trailer is not being used.

![WARNING]

Risk of electrocution.
Dump body coming near or contacting power lines may result in electrocution. Electrocution can occur without contact.
Be sure there are no overhead power lines over or near the trailer before raising dump body.

6. Standing well clear of the dump body, push the “UP” button on the control device until the dump body reaches approximately the halfway point of its dumping angle. Never leave the control device when operating the dump body.
7. Discontinue pushing the “UP” button and walk to the rear of the trailer so you can estimate if there is enough space for the remainder of the load to be safely dumped. If not, then you need to lower the dump body (by depressing the “DOWN” button) and pull the trailer forward and then repeat the previous step.
8. Standing well clear of the dump body, raise the dump body to the three quarter point of the maximum dump angle. Stop the lift and walk to
the rear to check to see if there is enough space for continued dumping.

9. Repeat the process until the load has been completely dumped.

10. If the load has not completely dumped DO NOT drive forward and stop quickly to “shock” the load out of the dump body. Also, DO NOT “jerk” the control button up and down to dislodge the load. The proper procedure for a stuck load is to lower the dump body and dislodge the material by hand.

11. Secure the rear doors prior to moving forward.

4.3.1.e Unload Bulk Material (Flowable Loads) Using The Spreader Gate

1. Read and understand the hoist operating procedure before operating the dump body.

2. Clear the area around the dump trailer.

3. Park the tow vehicle and trailer on a firm and level surface both left / right and front / rear. Attempting to unload on a soft or uneven surface may cause the trailer to overturn, which can result in death or serious injury.

4. For spreading material, the surface in which the tow vehicle and trailer will travel MUST be firm and level.

5. Set the metering chains at the desired number of links to control the opening distance of the spreader gate. Be sure to set both chains at equal length.

6. Unlatch spreader gate.

7. Unlock and open the hydraulic control box on the trailer tongue and locate the dump body control. Position yourself in a safe location clear of the dump body. Check for overhead power lines and other obstructions before raising dump body.

8. Press and hold “Up” button to raise the dump body. Release the button when the body has reached approximately the halfway point of its dumping angle, or if the load begins to shift.
rearward. Never leave the dump body control when operating the dump body.

9. Return the dump body control to the hydraulic control box. Watch for and avoid obstructions such as tree limbs, overhead lines, potholes, etc. and SLOWLY drive the tow vehicle and trailer ahead to spread the material.

10. **DO NOT** drive forward and stop quickly to “shock” the load out of the body. **DO NOT** “jerk” the control button up and down to dislodge the load. **The proper procedure for a stuck load is to fully lower the dump and dislodge the material by hand.**

11. You may need to raise the dump body higher after a portion of the load has been spread to place the remaining material at the rear of the dump body.

12. Return the dump body control to the hydraulic control box. Watch for and avoid obstructions such as tree limbs, overhead lines, potholes, etc. and SLOWLY drive the tow vehicle and trailer ahead to spread the material.

13. **DO NOT** drive forward and stop quickly to “shock” the load out of the body. **DO NOT** “jerk” the control button up and down to dislodge the load. **The proper procedure for a stuck load is to fully lower the dump and dislodge the material by hand.**

14. You may need to raise the dump body higher after a portion of the load has been spread to place the remaining material at the rear of the dump body.

15. Stop tow vehicle after all material has exited the dump body.

16. Press and hold “Down” button to lower the dump body. Release the button when the dump body is fully lowered. Return dump body control, close and lock the lid on the hydraulic control box.

17. Close and latch rear gate.

### 4.3.2 Hydraulic Components

Do not alter or substitute any hydraulic components on the dump trailer. The hoist system is designed with each component being compatible with the safe and reliable operation of the hoist system. **Under no circumstances should you alter the hydraulic pressure or flow rate to the hydraulic system. Doing so can result in death or serious injury.**

Always have the hoist system repaired or maintained by a qualified technician.

#### WARNING

**NEVER** alter or substitute any hoist system component. **Death or serious injury may result.**

**An altered or component substituted hoist system may malfunction, resulting in the dump body falling without warning.**

#### DANGER

**NEVER** alter or substitute any hoist system component.

### 4.3.3 Body Prop

The body prop supplied as part of the trailer is to be used only when the dump body is empty. The purpose of the body prop is a back-up to the hydraulic system and will hold the empty dump body in a raised position while performing maintenance on the hoist, trailer body, or the trailer itself.

**DO NOT** use the body prop to support a loaded dump body.

**DO NOT** perform maintenance under a raised dump body without first blocking the empty dump body up with the body prop.
Section 4 - Loading The Trailer

**DANGER**

Crushing hazard.
NEVER support a loaded dump body by the body props.
Unload the dump body before using body props.
NEVER enter the area under the dump body unless the empty dump body is supported by the body props.

**WARNING**

Risk of death by crushing.
Dump body can drop unexpectedly.
NEVER go under a raised dump body.
Use body prop for maintenance.

**WARNING**

Risk of death by crushing.
Make sure the dump body is empty.
DO NOT manipulate the body prop if a person is near the control.
5 CHECKING THE TRAILER BEFORE AND DURING EACH TOW

5.1 PRE-TOW CHECKLIST

Before towing, double-check all of these items:

- Tires, wheels and lug nut tightness (torque) (see the “Safety Information” section of this manual).
- Tire Pressure. Inflate tires on trailer and tow vehicle to the value indicated on the Certification / VIN label.
- Coupler secured and locked ball (see the “Coupling to the Tow Vehicle” section of this manual).
- Safety chains properly rigged to tow vehicle, not to hitch or ball (see the “Coupling to the Tow Vehicle” section of this manual).
- Test Tail, Stop, and Turn Lights.
- Test trailer brakes.
- Safety breakaway switch lanyard fastened to tow vehicle, not to safety chains (see the “Coupling to the Tow Vehicle” chapter of this manual).
- Cargo properly loaded, balanced and tied down (see the “Loading The Trailer” of this manual).
- Tongue weight and weight distribution set-up.
- Doors and gates latched and secured.
- Fire extinguisher.
- Flares and reflectors.

5.2 MAKE REGULAR STOPS

After each 50 miles, or one hour of towing, stop and check the following items:

- Coupler secured.
- Safety chains are fastened and not dragging.
- Cargo secured.
- Cargo door latched and secured.
- Check tires for signs of abnormal wear and loss of air pressure.
6 BREAKING-IN A NEW TRAILER

6.1 RETIGHTEN LUG NUTS AT FIRST 10, 25 & 50 MILES

Wheel lugs can shift and settle quickly after being first assembled, and must be checked after the first 10, 25 and 50 miles of driving. Failure to perform this check may result in a wheel coming loose from the trailer, causing a crash leading to death or serious injury. Refer to the “Inspection, Service & Maintenance” section for the proper tightening sequence and torque value for the wheel lugs nuts (bolts).

⚠️ WARNING
Lug nuts are prone to loosen after being first assembled. Death or serious injury can result.
Check lug nuts for tightness on a new trailer, and after re-mounting a wheel at 10, 25 and 50 miles.

6.2 ADJUST BRAKE SHOES AT FIRST 200 MILES (AXLES RATED 8000 LBS AND BELOW WITH HYDRAULIC BRAKES AND ALL AXLES WITH AIR BRAKES)

⚠️ WARNING
Brakes that are out of adjustment can result in death or serious injury.
Brakes must be adjusted at the intervals specified.

Brake shoes and drums experience a rapid initial wear. The brakes must be adjusted after the first 200 miles of use, and each 3,000 miles thereafter. Most axles are fitted with brake shoes that must be manually adjusted. Read your axle and brake manual to see if your brakes must be adjusted manually or if they adjust automatically. If you do not have the axle and brake manual, call Featherlite, Inc. at 800-800-1230 for assistance.

To adjust the trailer brakes, see section 8.2.3.c, “Manually Adjusting Brake Shoes,” for instructions.

6.3 SYNCHRONIZING THE BRAKE SYSTEMS

Trailer brakes are designed to work in synchronization with the brakes on the tow vehicle.

When the tow vehicle and trailer braking systems are synchronized, both braking systems contribute to slowing, and the tongue of the trailer will neither dive nor rise sharply.

⚠️ WARNING
If trailer and tow vehicle brakes do not work properly together, death or serious injury can occur.
Road test the brakes in a safe area at no more than 30 m.p.h. before each tow

To insure safe brake performance and synchronization, read and follow the axle/brake and the brake controller manufacturers’ instructions.

6.4 TIRE PRESSURE

Check tire pressures on both the trailer and tow vehicle. Inflate to the value indicated on the trailer Certification/VIN label located on the left front side.
This section provides some basic information for the safe operation of several accessories. For many accessories, such as generators and LP appliances, the manufacturer of the accessory has also provided instructions. You must read and follow these instructions before using the accessory. If you are uncertain whether you have all of the instructions, call Featherlite, Inc. at 800-800-1230 before operating the accessory. The following accessories are described in this section:

- Accessory Battery
- Electric-powered Landing Gear

Many accessories introduce the risk of fire and carbon monoxide poisoning. If you have an accessory on your trailer, make sure you have a fire extinguisher charged and ready before operating the accessory. Check the fire extinguisher at least once a month. If the fire extinguisher is discharged even partially, it must be recharged. Follow the fire extinguisher manufacturer’s instructions for recharging the extinguisher after use.

### 7.1 ACCESSORY BATTERY

Your trailer may be outfitted with an accessory battery that operates lighting, electric landing gear, slide-outs or other accessories. An accessory battery may be kept charged either by the tow vehicle or by the generator or shore power. A disconnect switch may be provided to disconnect the accessory battery when you do not plan to be using the trailer for an extended period, such as seasonal storage. If there is no disconnect switch, then remove the cables from the battery terminals.

The accessory battery must be kept in a charged condition during storage. The battery could freeze and break if it becomes discharged.

### 7.2 ELECTRIC-POWERED LANDING GEAR

The landing gear (also known as the jack) on your trailer may be powered with an electric motor. The landing gear is operated up or down using controls located near the landing gear.
8 Inspection, Service & Maintenance

8.1 Inspection, Service & Maintenance Summary Charts

You must inspect, maintain and service your trailer regularly to insure safe and reliable operation. If you cannot or are unsure how to perform the items listed here, have your dealer do them. Note: In addition to this manual, also check the relevant component manufacturer's manual.

### 8.2 Inspection and Service Instructions

#### 8.2.1 Axle Bolts, Frame, Suspension, & Structure

**WARNING**

Worn or broken suspension parts can cause loss of control and injury may result.

Have trailer professionally inspected annually and after any impact.

To perform many of the inspection and maintenance activities, you must jack up the trailer. Figure 8-1 indicates the general areas where jacks and jack stands may be applied.

When jacking and using jack stands, place them so as to clear wiring, brake lines, and suspension parts (springs, torsion bars, etc.). Place jacks and jack stands inside of the perimeter strip on the supporting structure to which the axles are attached.
Section 8 - Inspection, Service & Maintenance

8.2.2 Trailer Structure

Wash the entire trailer thoroughly immediately after exposure to road salt and liquid deicer. The salt and liquid deicer will corrode and pit the aluminum.

8.2.2.a Fasteners and Frame Members

Inspect all of the fasteners and structural frame members for bending and other damage, cracks, or failure. Repair or replace any damaged fastener and repair the frame member. If you have any questions about the condition or method of repair of fasteners or frame members, get the recommendation of, or have the repair done by, your dealer.

The various fastener types used on your trailer are:

- Bolts, which are used mainly for attaching door and gate hinges to the trailer body;
- Buck Rivets, which are used to attach the sides and roof panels of the body to each other, and to the frame of the trailer; and
- Huck Bolts may be at various locations on the sub-frame. See figure 8-2. Huck bolts are not user serviceable. If you detect a loose huck bolt fastener, do not tow the trailer. Call your dealer for instructions.

8.2.2.b Welds

All welds can crack or fail when subjected to heavy loads or movement of cargo that was not properly tied to prevent movement. Any time that you know or suspect that the trailer has been subjected to heavy loads or movement of cargo, immediately inspect the welds and fasteners for damage. To prevent severe damage to your trailer, inspect all of the welds for cracks or failure at least once a year.

WARNING

Broken or damaged fasteners or welds can cause injury or damage to trailer and contents.
Inspect trailer before each use and repair or replace all damaged parts.

8.2.3 Trailer Brakes (Nev-R-Adjust® Forward Adjusting Brakes)

Trailers equipped with Nev-R-Adjust® forward self-adjusting brakes require no manual brake adjustment.

During travel, the brakes automatically rotate an adjuster assembly to close the gap caused by lining wear. This eliminates the need for manual brake adjustments.
8.2.3.a Periodic Inspection

Properly functioning brake shoes and drums are essential to ensure safety. You must have your dealer inspect these components at least once per year, or each 12,000 miles.

8.2.3.b Brakes, Electric

Two different types of electric brakes may be present on the trailer: an emergency electric breakaway system, which acts only if the trailer comes loose from the hitch and the breakaway pin is pulled. The other brake is an electric braking system that acts whenever the brakes of the tow vehicle are applied.

Tow Vehicle Operated Electric Brakes

The electric brakes that operate in conjunction with the tow vehicle brakes must be “synchronized” so that braking is properly distributed to the tow vehicle brakes and the trailer brakes. For proper operation and synchronization, read and follow the axle/brake and the brake controller manufacturers’ instructions.

Breakaway Battery

This battery supplies the power to operate the trailer brakes if the trailer uncouples from the tow vehicle. Be sure to check, maintain and replace the battery according to the battery manufacturer’s instructions.

Breakaway Switch

This switch causes the breakaway battery to operate the electric brakes if the trailer uncouples from the tow vehicle.

The lanyard for the pull pin is connected to the tow vehicle, and the switch is connected to the trailer. To check for proper functioning of the switch, battery and brakes, you must pull the pin from the switch and confirm that the brakes apply to each wheel. You can do this by trying to pull the trailer with the tow vehicle, after pulling the pin. The trailer brakes may not lock, but you will notice that a greater force is needed to pull the trailer.

WARNING

If electric breakaway brakes do not operate when trailer is uncoupled from the tow vehicle, death or serious injury can occur.

Check emergency breakaway brake system BEFORE each tow.

Magnets for Electric Brakes

To make certain an electrically-operated braking system will function properly, you must have your dealer inspect the magnets at least once a year, or each 12,000 miles. See the brake manual for wear and current inspection instructions.

8.2.3.c Brakes, Hydraulic (Vacuum, Air or Electric Operated)

If your trailer has hydraulically-operated brakes, they function the same way the hydraulic brakes do on your tow vehicle. The hydraulic braking system must be inspected by a dealer, at least as often as the brakes on the tow vehicle, but no less than once per year. This inspection includes an assessment of the condition and proper operation of the wheel cylinders, brake shoes, brake drums and hubs.

You must check the fluid level in the master cylinder reservoir at least every three months. If you tow your trailer an average of 1,000 miles per month in a hot and dry environment, you must check the brake fluid level once a month. The brake fluid reservoir is located on the tongue of the trailer or near the gooseneck. Fill with DOT 4 brake fluid.

Vacuum-Operated Hydraulic

When towing a trailer, the vacuum gauge, which is located inside the cab of the tow vehicle, must indicate 18 In. Hg. (inches of mercury) or more at all times.

WARNING

Vacuum gauge in tow vehicle must be at or above 18 In. Hg. If not, brakes may be rendered inoperable and unsafe. Low vacuum will cause damage to the brake system.
Section 8 - Inspection, Service & Maintenance

Air Pressure-Operated Hydraulic

Air/hydraulic braking systems are typically used when the tow vehicle has a diesel engine. The tow vehicle has an air compressor that routes the air to an air/hydraulic mechanism, which sends brake fluid to the wheel cylinders.

The air pressure gauge in your tow vehicle indicates the current air pressure. See your tow vehicle manual for the proper air pressure.

Electrical-Operated Hydraulic

Electric/hydraulic braking systems, which are mounted on the trailer, use a small electrically-driven pump to generate hydraulic pressure, which operates the brake cylinders. Like electrical brakes, an electric/hydraulic braking system is operated by an electrical signal from the tow vehicle.

8.2.4 Trailer Brakes (Axles Rated 8000 lbs and Below with Hydraulic Brakes and ALL Axles with Air Brakes)

8.2.4.a Initial Inspection

**WARNING**

Brakes that are out of adjustment can result in death or serious injury.

Brakes must be adjusted at the intervals specified.

The brake shoes must be adjusted after the first 200 miles of use, and each 3,000 miles thereafter.

Most axles are not fitted with a brake mechanism that will adjust the brakes. Brakes must be adjusted manually. It is critical that the brakes be adjusted at the specified intervals. Brakes that are out of adjustment can cause a collision, which may result in death or serious injury.

8.2.4.b Periodic Inspection

Properly functioning brake shoes and drums are essential to ensure safety. You must have your dealer inspect these components at least once per year, or each 12,000 miles.

8.2.4.c Manually Adjusting Brake Shoes

Some braking systems are not automatically adjusted by hard stopping. These brakes require manual adjustment. The following steps apply to adjust most manually adjustable brakes. Read your axle and brake manual to see how to adjust your brakes.

- Jack up the trailer and secure it on adequate capacity jack stands.
- Be sure the wheel and brake drum rotate freely.
- Remove the adjusting-hole cover from the adjusting slot on the bottom of the brake backing plate.
- With a screwdriver or standard adjusting tool, rotate the starwheel of the adjuster assembly to expand the brake shoes. Adjust the brake shoes out until the pressure of the linings against the drum makes the wheel very difficult to turn.
- Note: Your trailer maybe equipped with drop spindle axles. See axle manual for your axle type. You will need a modified adjusting tool for adjusting the brakes in these axles. With drop spindle axles, a modified adjusting tool with about an 80 degree angle should be used.
- Rotate the starwheel in the opposite direction until the wheel turns freely with a slight drag.
- Replace the adjusting-hole cover.
- Repeat the above procedure on all brakes.
- Lower the trailer to the ground.

8.2.4.d Brakes, Hydraulic (Vacuum, Air or Electric Operated)

If your trailer has hydraulically-operated brakes, they function the same way the hydraulic brakes do on your tow vehicle. The hydraulic braking system must be inspected by a dealer, at least as often as the brakes on the tow vehicle, but no less than once per year. This inspection includes an assessment of the condition and proper operation of the wheel cylinders, brake shoes, brake drums and hubs.

You must check the fluid level in the master cylinder reservoir at least every three months. If you tow your trailer an average of 1,000 miles per month in a hot and dry environment, you must check the brake fluid level once a month. The brake fluid reservoir is located on the tongue of the trailer or near the gooseneck. Fill with DOT 4 brake fluid.

Vacuum-Operated Hydraulic

When towing a trailer, the vacuum gauge, which is located inside the cab of the tow vehicle, must
indicate 18 In. Hg. (inches of mercury) or more at all times.

**WARNING**

Vacuum gauge in tow vehicle must be at or above 18 In. Hg. If not, brakes may be rendered inoperable and unsafe. Low vacuum will cause damage to the brake system.

### Air Pressure-Operated Hydraulic

Air/hydraulic braking systems are typically used when the tow vehicle has a diesel engine. The tow vehicle has an air compressor that routes the air to an air/hydraulic mechanism, which sends brake fluid to the wheel cylinders.

The air pressure gauge in your tow vehicle indicates the current air pressure. See your tow vehicle manual for the proper air pressure.

### Electrical-Operated Hydraulic

Electric/hydraulic braking systems, which are mounted on the trailer, use a small electrically-driven pump to generate hydraulic pressure, which operates the brake cylinders. Like electrical brakes, an electric/hydraulic braking system is operated by an electrical signal from the tow vehicle.

### 8.2.5 Trailer Connection to Tow Vehicle

#### 8.2.5.a Coupler and Ball

The coupler on the trailer connects to the ball attached to the hitch on the tow vehicle. The coupler, ball and hitch transfer the towing forces between the tow vehicle and the trailer. Before each tow, coat the ball with a thin layer of automotive bearing grease to reduce wear and ensure proper operation; and check the locking device that secures the coupler to the ball for proper operation.

If you see or feel evidence of wear, such as flat spots, deformations, pitting or corrosion, on the ball or coupler, immediately have your dealer inspect them to determine the proper action to prevent possible failure of the ball and coupler system. All bent or broken coupler parts must be replaced before towing the trailer.

The coupler handle lever must be able to rotate freely and automatically snap into the latched position. Oil the pivot points, sliding surfaces, and spring ends with SAE 30W motor oil. Keep the ball pocket and latch mechanism clean. Dirt or contamination can prevent proper operation of the latching mechanism.

When replacing a ball, the load rating must match or exceed the GVWR of the trailer.

#### 8.2.5.b Gooseneck

The gooseneck receiver on the trailer connects to a hitch-mounted ball on the towing vehicle. The receiver, ball and hitch transfer the towing forces between the tow vehicle and the trailer. Before each tow, coat the ball with a thin layer of automotive bearing grease to reduce wear and ensure proper operation; and check the locking device that secures the receiver to the ball for proper operation.

If you see or can feel evidence of wear, such as flat spots, pitting or corrosion, on the ball or receiver, immediately have your dealer inspect them to determine the proper action to prevent possible failure of the ball and receiver system.

When replacing a ball, the load rating must match or exceed the GVWR of the trailer.

#### 8.2.5.c Fifth Wheel Kingpin

Before each tow, inspect the fifth wheel and kingpin for wear, and coat the contact surface of the fifth wheel plate with water-resistant Lithium-base grease. If you see evidence of wear on the fifth wheel or kingpin, immediately have your dealer inspect them to determine the proper action to prevent failure of the fifth wheel and kingpin system.

#### 8.2.6 Landing Leg or Jack

If a grease fitting is present, you must use a grease gun to lubricate the jack mechanism. Grease the gears in the top of hand-cranked jacks once a year, by removing the top of the jack and pumping or hand packing grease into the gears.
8.2.7 Lights and Signals

Before each tow, check the trailer taillights, stoplights, turn signals and any clearance lights for proper operation.

**WARNING**

To avoid collisions, taillights, stoplights and turn signals must work.

8.2.8 Accessory Battery

Your trailer may be outfitted with an accessory battery that operates lighting, electric landing gear, slide-outs or other accessories. An accessory battery may be kept charged either by the tow vehicle or by the generator or shore power. See the manual for the accessory battery.

A disconnect switch may be provided to disconnect the accessory battery when you do not plan to be using the trailer for an extended period, such as seasonal storage. If there is no disconnect switch, then remove the cables from the battery terminals. The accessory battery must be kept in a charged condition during storage. The battery could freeze and break if it becomes discharged.

8.2.9 Tires

Before each tow, be sure the tire pressure is at the value indicated on the Certification / VIN label. Tire pressure must be checked while the tire is cold. Do not check the tire pressure immediately after towing the trailer. Allow at least three hours for a tire to cool, if the trailer has been towed for as much as one mile. Replace the tire before towing the trailer if the tire treads have less than 2/32 inch depth or the telltale bands are visible.

A bubble, cut or bulge in a side wall can result in a tire blowout. Inspect both side walls of each tire for any bubble, cut or bulge; and replace a damaged tire before towing the trailer.

**WARNING**

Worn, damaged or under-inflated tires can cause loss of control, injury and damage. Check tires before each tow.

8.2.10 Hydraulic Cylinder Pin

**DANGER**

Crushing hazard.

NEVER enter the area under the trailer unless the trailer is empty and supported by the deck prop.

Lubricate the hydraulic cylinder pin (A) every 6 months.

8.2.11 Wheel Rims

If the trailer has been struck, or impacted, on or near the wheels, or if the trailer has struck a curb, inspect the rims for damage (i.e. being out of round); and replace any damaged wheel. Inspect the wheels for damage every year, even if no obvious impact has occurred.

Never install aftermarket wheels or lug nuts on your trailer. Use only original equipment wheels and lugs nuts. Aftermarket wheels and lug nuts may not meet the load carrying requirements, pressure capacity and offset as the original equipment.
8.2.12 Wheel Liners (Simulators)

Your trailer may be equipped with wheel liners (simulators). See figure 8-4. To remove the liners to access the wheel lugs:

1. Locate the two removable jam nuts (1). These nuts will have a crimp mark on every other hex and are 180 degrees apart.
2. Remove the jam nuts. Do not use power tools on jam nuts.
3. Remove the hub cover (2), wheel liner (3), spacers (4) and stud extenders (5).

To install the liners:
1. Install stud extenders (5) 180 degrees apart and tighten to 30 lb. ft. of torque.
2. Install spacers (4), wheel liner (3), hub cover (2) and jam nuts (1). Tighten jam nuts to 30 lb. ft. of torque.

8.2.13 Wheel Bearings

A loose, worn or damaged wheel bearing is the most common cause of brakes that grab.

To check your bearings, jack trailer and check wheels for side-to-side looseness. If the wheels are loose, or spin with a wobble, the bearings must be serviced or replaced.

Your trailer will be equipped with one of the following types of wheel bearings:

- Standard – Bearing are lubricated by grease or oil.
- E-Z Lube® or other grease fitting lubricated bearings - Bearings are lubricated by grease and are identified by a grease fitting on the end of the axle.
- Nev-R-Lube™ or other sealed bearings – The bearings are sealed and require no routine lubrication.

Refer to this manual and the axle manufacturers information for inspection and service information.

8.2.13.a Standard Bearings

Bearing Lubrication – Grease

Disassemble, inspect and re-pack the wheel bearings every 12 months or 12,000 miles, whichever occurs first.

If a trailer wheel bearing is immersed in water, it must be repacked after each immersion.

If your trailer has not been used for an extended amount of time, have the bearings inspected and packed more frequently, at least every six months and prior to use.

Follow the steps below to disassemble and service the wheel bearings.

- After removing the grease cap, cotter pin, spindle nut and spindle washer (items 7-10 in “Standard Wheel Bearing” figure 8-5), remove the hub and drum to inspect the bearings for wear and damage.
- Replace bearings that have flat spots on rollers, broken roller cages, rust or pitting. Always replace bearings and cups in sets. The inner and outer bearings are to be replaced at the same time.
- Replace seals that have nicks, tears or wear.
• Lubricate the bearings with a high quality EP-2 automotive wheel bearing grease.

Every time the wheel hub is removed and the bearings are reassembled, follow the steps below to check the wheel bearings for free running and adjust.

• Turn the hub slowly, by hand, while tightening the spindle nut, until you can no longer turn the hub by hand.
• Loosen the spindle nut just until you are able to turn it (the spindle nut) by hand. Do not turn the hub while the spindle nut is loose.
• Put a new cotter pin through the spindle nut and axle.
• Check the adjustments. Both the hub and the spindle nut should be able to move freely (the spindle nut motion will be limited by the cotter pin).

**Bearing Lubrication – Oil**

If your trailer is equipped with oil lubricated bearings, check the oil level every 6 months or 6,000 miles, whichever occurs first.

The oil can be filled through the oil fill hole in the hub or cap. Fill to the level indicated on the hub or cap.

**8.2.13.b E-Z Lube® Bearings (Standard Equipment on Axles Rated 8000 lbs. and Below)**

Bearings should be lubricated every 12 months or 12,000 miles, whichever occurs first.

Use only LITHIUM COMPLEX NLGI CONSISTENCY #2 GREASE. Other types of grease may not be compatible.

These hubs and bearings have been lubricated at the factory. The bearings can be periodically lubricated without removing the hubs.

Remove the rubber plug and attach a grease gun to the grease fitting. Apply grease until new grease comes out around slotted spindle nut. Wipe off any excess and reinstall the rubber plug.

**8.2.13.c Nev-R-Lube™ or Other Sealed Bearings**

Bearing should be inspected every 12 months or 12,000 miles, whichever occurs first. Refer to the axle manufactures manual for information on checking wheel end play and clearance. See figure 8-7.

**8.2.14 Lug Nuts (Bolts)**

Lug nuts are prone to loosen right after a wheel is mounted to a hub. When driving on a remounted wheel, check to see if the lug nuts are tight after the first 10, 25 and 50 miles of driving and before each tow thereafter.

**Lug Nut Tightening (Torque)**

Being sure wheel mounting nuts (lug nuts) on trailer wheels are tight and properly torqued is an important responsibility that trailer owners and users need to be familiar with and practice. Inadequate and/or inappropriate wheel nut torque (tightness) is a major reason that lug nuts loosen in service. Loose lug nuts can rapidly lead to a wheel separation with potentially serious safety consequences.
• Be certain you have a clear understanding of the specific wheel maintenance responsibilities your vehicle manufacturer requires/recommends you, as the owner, must perform in order to insure your wheel equipment is safely maintained. Check the lug nut tightness the first 10, 25 and 50 miles of driving and before each tow thereafter. Refer to the owner’s manual and speak with your dealer if you have any questions about proper tightening practices.

• The only way to be certain you have checked the tightness or torqued the lug nuts to the proper value is with a torque wrench. Four-way wrenches, ratchets, and similar tools can be useful for short-term emergency repairs but are not appropriate tools for accurately checking lug nut torque. You must use a torque wrench to accurately indicate the torque that you are applying to the lug nut.

• Keep a record of the date and approximate mileage when you check the lug nut torque. Note any lug nut that has lost torque. Investigate the reason(s) if the lug nut torque is not maintained after more than one re-torque application, because this indicates there is something wrong with the lug nuts, nut studs, wheels and/or hubs and should be corrected.

• Contact your dealer or vehicle manufacturer immediately if you experience any persistent lug nut loosening or any other lug, wheel or axle problems.

• In the event of a wheel separation incident, notify the vehicle manufacturer and dealer. Seek prompt professional assistance in assessing the trailer and its gear, and retain, but don’t re-use involved lugs, wheels and studs. Don’t repair or service the trailer yourself. Contact a trained technician.

**WARNING**

Lug nuts are prone to loosen after being first assembled. Death or serious injury can result.

Check lug nuts for tightness on a new trailer, and after re-mounting a wheel at 10, 25 and 50 miles.

**WARNING**

Metal creep between the wheel rim and lug nuts (bolts) will cause rim to loosen.

Death or injury can occur if wheel comes off.

Tighten lug nuts (bolts) before each tow.

Tighten the lug nuts to the proper tightness to prevent wheels from coming loose. Refer to the steps that follow and the axle manufacturer’s information. Use a calibrated torque wrench to tighten the lug nuts. Over-tightening may result in breaking the studs or permanently deforming the mounting stud holes in the wheels.

Remove all excess paint, oil and grease from mounting surfaces.

Start all lug nuts by hand to prevent cross threading.

Tighten lug nuts in sequence shown in “Lug Nut Sequence of Tightening” figure 8-8.

**Never install aftermarket wheels or lug nuts on your trailer.** Use only original equipment wheels and lugs nuts. Aftermarket wheels and lug nuts may not meet the load carrying requirements, pressure capacity and offset as the original equipment.

Never install aluminum wheels on hubs/studs that were designed for steel wheels. The stud length required for aluminum wheels is greater than that required for steel wheels.

**WARNING**

Aftermarket wheels may part from the trailer, resulting in death or serious injury.

Never install aftermarket wheels or lug nuts on your Featherlite trailer.

Never install aluminum wheels on hubs/studs that were designed for steel wheels.
Information or torque values stamped on lug nuts supersedes the information listed in this manual.

Lug Nut Torque - Figure 8-9

Lug nuts are prone to loosen right after a wheel is mounted to a hub. When driving on a remounted wheel, check to see if the lug nuts are tight after the first 10, 25 and 50 miles of driving and before each tow thereafter.

- **WARNING**
  - Metal creep between the wheel rim and lug nuts (bolts) will cause rim to loosen.
  - Death or injury can occur if wheel comes off.
  - Tighten lug nuts (bolts) before each tow.

Lug nuts are prone to loosen after being first assembled. Death or serious injury can result.

Check lug nuts for tightness on a new trailer, and after re-mounting a wheel at 10, 25 and 50 miles.
9 TECHNICAL REFERENCE

9.1 TRAILER LIGHTING ELECTRICAL CONNECTION

The electrical wiring on your Featherlite trailer has been designed and built in accordance with all the Federal Motor Vehicle Safety Standards that were in effect when the trailer was produced.

The figure below illustrates the wiring code that has been adopted for several types of electrical lighting connectors.

Note: These diagrams show typical Featherlite installation. The wiring on your trailer may vary.
9.2 HITCH SYSTEMS

The various components of trailer fastening systems may be referred to in terms of “Class” depending on their load rating. The rating of hitch systems on tow vehicles also considers whether the hitch only carries the tongue weight (for example, a ball hitch, which is also referred to as a Weight Carrying Hitch), or if it distributes the tongue weight to all of the tow vehicle wheels (also referred to as a Weight Distributing Hitch).

Your hitch or hitch ball may carry a “class” rating instead of a pound rating. This chart may be used to cross reference hitch/ball classification with trailer weight and tongue weight.

Hitch Classification
